The branches hereof, although ſome of them riſe above the ground, yet take they roote below, having ſomewhat broad and long leaves on them, wholly greene, ſo that but that the flowers doe appeare like unto the reſt, none would take it to be a Willow.

8. *Salix anguſtiſſimis & longiſſimis foliis.*
The longeſt leafed Willow.

This low Willow hath yellowiſh rods, with the longeſt narroweſt leaves of any of the reſt, white on both ſides, but

ſome-

somewhat knobby underneath, this hath also scaly heads of leaves, at the ends of the branches as the fifth.

The Place and *Time.*

The first is alwayes planted in the low grounds that are often overflowen, where it onely will thrive: the other sorts, some are found growing with the last sort, or by them in sundry the said and the like places with us, and in *Hungaria, Austria, &c.* as *Clusius* and *Bauhinus* have set it downe.

The Names.

The first is called *Salix Vitellina* by *Cordus* on *Dioscorides*, and by *Dodonæus*, and is the third *Salix* of *Tragus* and *Cæsalpinus*, *Gerard* calleth it *aquatica*, as the fittest name to distinguish it from the rest, and so doe I: It is also called *Vincus a vinciendo*. *Lugdunensis* maintaineth it to be the *Salix Amerina* of *Pliny*, against *Ruellius* and *Matthiolus*, he should have said also, who would make the *Vitex* or *Agnus castus* to be the *Salix Amerina* of the Latines, because that among the bastard names in *Dioscorides*, it is there so set downe, but they differ much, as you shall here more in the next Chapter. For *Lugdunensis* saith that they of *Lyons*, and the Mountainers in *Savoy* do call it yet to this day, *des Amerines*, which they of *Paris* call *Osiers*, and they of *Normandy*, *des Ambres*. Some also, as *Lugdunensis* saith in the Chapter of *Grossularia* and *Salix*, would make the ἴουν of *Theophrastus* to bee *Amerina*, but *Isos* or *Oesus* giveth *Vvas* as he saith, whose liquor he calleth ἰουνδν, not unlike to thicke blackish Wine, but enclining more to purple. The second is the first *pumila angustifolia* of *Clusius*. The third is his second, and the *Salix humilis repens* of *Lobel*. The fourth is so called by *Bauhinus* as it is in the title. The fifth is taken by *Lugdunensis* to be the *Salix Helice* of *Theophrastus*, and by *Bauhinus*, *Salix humilis capitulo squammoso*. The sixt and seaventh are mentioned onely by *Bauhinus*, and the last by *Lugdunensis*, and is his sixth sort. Their *English* names are fitted to every of them, as I thinke is fittest for them.

The Vertues.

I thought fit to shew you what particular property is in each of these Willowes altogether, and not to make many places or repetitions. All of these in generall are cooling, drying, thickning and binding: both the leaves and the barke, and the seede especially, are used for any of those effects, as to stanch bleeding of wounds, and at the mouth or nose, and spitting of blood, as also al other fluxes of blood in man or woman, and likewise to stay casting, and the desire thereunto, if the decoction of them in Wine be drunke: it helpeth also to stay thinne hot and sharpe, salt, distillations from the head upon the lunges, causing a consumption: the leaves bruised with some pepper and drunke in wine, doe much helpe the winde chollicke, the leaves bruised and boiled in wine being drunke, doth much stay the heate of lust, and wholly extinguish it, if it be long used both in man and woman, the seede also is of the same effect. The water that is gathered from the Willow while it flowreth, the barke being slit, and a vessell apt to receive it, being fitted to it, is very good for rednesse, and dimme eye-sight, and filmes that begin to grow over them, and stay the rheumes that fall into them, to provoke urine being stopped if it be drunke, and to cleare the face and skinne, of any spots or discolourings: the flowers saith *Galen*, have a stronger effect to dry up any fluxe or humour, being a medicine without any sharpenesse, and the barke much more, as all barkes doe, but if the barke be burnt and used, it doth yet dry more forcibly, and being mixed with vinegar, it taketh away warts, and cornes, and other the like flesh that groweth on the hands or feete, or other parts: the decoction of the leaves and barke in wine, is good to bathe the sinewes, as also the places pained with the gout, and to cleanse the head or other parts of scurfe, the juyce of the leaves and greene barke, mingled with some Rose water, and heated in the rinde of a Pomegarnet is singular good to helpe deafenesse to be dropped into the eares: the seede of the blacke Willow mixed with litharge of silver in equall quantity, made into an oyntment and used on any place where the haire groweth that you would take away, after it hath beene bathed well before, or else in the baine or stove doth cause it to fall away. Of the twigges or rods are made many sotts of workes, both fine and course baskets, chaires, cradles, and many other the like: bands also both greater and lesser, to binde up Vines, Trees, Hedges, and many other things, hoopes also, and the small twigges, to binde the hoopes stakes also, and poles both high and low, to hold up or fasten hedges, bushes, &c. unto, and many more the like things. *Tragus* remembreth a pretty fained controversie betweene the Boxe and the Willow, written in the *Germane* tongue, whether of them were of the better use in the common wealth, or might best be spared. Of the Sallow especially, but of the other Willow trees in generall, the best coles are made to make Gunpouther withall, as is well knowne, and with the coles likewise, the finest Painters draw their first draughtes: the *Castor* or Bever delighteth chiefely to make his residence among the Willowes, and Osiers, in the Waters sides.

CHAP. XXXIII.

Spirea Theophrasti Cluſij. Clusius his spiked Willow of *Theophastus*.

THis strange Willow (for so it is most like) groweth to be a small low bush of three or foure foote high spreading forth slender branches covered with a reddish barke, whereon are set without order, many long and narrow leaves most like unto the Willow, of a pale greene colour on the upperside, and browne underneath, finely dented about the edges, of a drying taste, with some bitternesse: at the ends of the branches come forth thick bushing spikes, or clusters of bluish coloured flowers, consisting of five leaves a peece, with some threds in the middle, of the same colour, without any sent, which turne into small five square heads with very small seede like dust within them, of a yellowish colour.

The Place and *Time.*

This was sent out of *Silesia* to *Vienna* to *Clusius* by *Sibilius*, the Duke of *Briga*, his learned Apothecary, where it is most likely it grew, and flowred in *May* with *Clusius*, and the seede was ripe in *August*.

The Names.

Clusius saith he that sent it tooke it to bē a *species* of *Syringa*, and questioned *Clusius* whether it should not bee referred

referred thereunto, but hee seriously considering thereon, could not finde it like to any plant that he knew, and therefore judged it most neerely to represent the ἀκτέη or as, some reade it πίτυρα of *Theophrastus*, which hee putteth among those trees that beare spikes, as *Spiræa*, *Erica*, *Agnus*, and some others *lib.*1. *c.*23. and withall *Clusius* saith that this doth more fitly agree to his *Spiræa*, then the *Tiburnum Matthioli*, as some would have it.

The Vertues.

There are no property mentioned of this plant, whereunto it might be serviceable in Physick or otherwise, and therefore let this suffice.

Spiræa Theophrasti forte Clusio.
Clusius his spiked Willow of Theophrastus.

CHAP. XXXIV.

Vitex sive Agnus Castus. The Chaste tree.

THe Chaste tree is of two sorts, one with narrower, and another with broader leaves the one dented and the other not, the one with whitish and the other with purplish flowers.

1. *Vitex folio angusto.* Narrow leafed Chaste tree.

This riseth up taller then a shrub, unto the height of a low tree, with divers branches covered with a darke coloured barke, and are lithy easie to bend, with sundry large leaves cut or divided like unto Hempe leaves, either into five or seven parts or leaves, each of them being long and narrow like Willow leaves but smaller, and not dented at all about the edges: at the ends of the branches come forth long spikes of flowers, somewhat like unto Lavander spikes, stored with blush white flowers at severall spaces up to the toppes, after which come small round seede, of the bignesse and likenesse aknost of pepper, whereupon some have called it *Piper agreste*, but neerer unto Coriander seede, but of a blackish gray colour, and tasting somewhat hot and strong.

Vitex sive Agnus vasius folio angusto.
The Chaste tree.

2. *Vitex folio latiore*, The broader leafed Chaste tree.

This groweth lower and lesser then the former, having the like leaves divided as it, but each somewhat broader, and dented about the edges, more white and woolly also then they, the flowers grow in spikes after the same manner, of a blewish purple colour, the seed that followeth is also like the other.

The Place and *Time.*

These grow in the further part of *France*, in *Italy*, and *Spaine*, usually by waterssides and in the moister grounds, these colder Countries doe onely nurse them up in Gardens for their rarity and use: they flower in *July*, and the seede is ripe in *August* in the naturall places, but will hardly flower with us.

The Names.

It is called in Greeke ἄγνος, that is, *Castus quod castitatem conservet iis quibus aut estur, aut bibitur, aut substernitur* as *Galen* saith, or as *Dioscorides* saith, because the *Athenian* matrons, in their *Thesmophoria*, did use these leaves as sheetes to lye upon, thereby to preserve their chastity, the Physitians and Apothecaries joyning both words together call it *Agnus castus*, the Latines also call it *Vitex*, it is likewise called in Greeke λύγος, *Lygos quasi vimen propter invicta fere ramorum flexilitatem.* *Lobel* in *Adversaria* taketh it to be Ἄλαγνος of *Theophrastus lib.*4. *c.*11. which he saith is like the other *Amerina*, but beareth no fruite, yet the flower is like the white Poplar flower, which how it may agree there with I cannot see, for

this beareth fruite in a plentifull manner in the naturall places. Some alſo would make it to be the *Salix Amerina*, as I ſaid in the former Chapter, becauſe *Gaza* tranſlateth ἄγνος in *Theophraſtus* unto *Amerina* in Latine, *lib.* 1. *c.* 5. and 22. and 23. from whence ſprang that errour. Some alſo as *Lugdunenſis* ſaith *fol.* 133. would more truely make the ἄγνος of *Theophraſtus* to be this ἄγνος *Vitex*, becauſe of the different colours in the flowers of both, but as I ſhewed in the Chapter before, *Theophraſtus* giveth white and blacke berries, as well as flowers, to his Ἴτεος or *Oeſus*, whoſe liquor he calleth οἶνον ἄκρατον a kinde of Wine, ſo that it can no way agree thereunto: all Authours call both theſe ſorts *Vitex* or *Agnus caſtus*. The *Arabians* call it *Famanches*, *Samaches*, and *Bengiches*, the *Italians Vitice*, and *Agno caſto*, the *Spaniards Gatillo caſto*, the *French Agnus caſtus*, the *Germanes Schaffs mullem*, and *Keuſchlamp*, and we in *Engliſh* Chaſte tree.

The Vertues.

The leaves and ſeede of the Chaſte trēe as *Galen* ſaith, is hot and dry in the third degree, and of a very thinnē eſſence or ſubſtance, ſharpe alſo and binding, for ſo it declareth it ſelfe to them that uſe it, yea the ſeede is perceived plainely to be ſo hot that it procureth headache, yet being parched or fryed it will the leſſe trouble the head, beſides it diſſolveth the winde in the ſtomacke or belly being freſh, but being fryed or parched much more: it reſtraineth alſo the intigations to Venery in any manner uſed and taken: thus farre *Galen*, unto whom *Paulus* and *Ætius* doe conſent affirming the ſame things. The ſeede being drunke reſiſteth the bitings of venemous beaſts, Spiders or the like, and helpeth the dropſie, and thoſe that are troubled with the ſpleene, it alſo procureth milke in womens breſts, it procureth their courſes, and the urine ſtopped, if a dramme thereof in pouther be taken in Wine or with Pennyroyall: it troubleth the head and cauſeth ſleepe: the decoction of the herbe and ſeedes is very good for women troubled with the paines of the mother, or inflammations of the parts: the hot fumes thereof taken underneath, is no leſſe effectuall: applyed to the head it eaſeth the paines thereof, and with oyle and vinegar, the Lethargy, and Frenſie: the ſame alſo made into a pultis with Vine leaves, and applyed to the cods that are ſwolne and growne hard, doth helpe them: it is ſaid to helpe an ague, being taken before the fit, and being annointed therewith made up with oyle to provoke ſweate: the ſame alſo uſed to the limmes taketh away wearineſſe upon travaile or labour: the leaves are almoſt as effectuall as the ſeede, for all the purpoſes aforeſaid, and are good for wounds alſo: the ſeede uſed with Barley meale, doth mollifie hard ſwellings, and breake Impoſtumes: and with niter and vinegar it helpeth freckles of the face; uſed with honey it helpeth the ſores in the mouth and throate. *Galen* although ſo famous a writer and Phyſition contrary eth himſelfe in this one plant, once or twiſe, for having affirmed before that the ſeede hereof is hot and dry *lib.* 1. *Alimentorum*, he ſaith, having ſpoken of the properties of Hempe ſeede, that the ſeede of *Vitex* doth reſtraine Venereous deſires, and giveth little nouriſhment to the body, and that becauſe it is cooling and drying. In another place he ſaith (ſpeaking of *Archigenes* medicines for the headache) among other things, that of the leaves of the Bay tree, the Poplar, and the *Vitex* or Chaſte tree with vinegar and oyle, he made a medicine of differing properties: for the Bay tree leaves are very hot, and thoſe of the Chaſte tree moderately cold, and in the meane betweene both are the Poplar leaves: in both which places you ſee he maketh this Chaſte tree to be cold, when before he had placed it; not among thoſe that were temperate, but in the third degree of heate: yet ſome of good Wit to free *Galen* from this laſt errour, would invert the Text and ſay that the Bay leaves are the hotteſt, the Poplar the coldeſt, and the Chaſte tree leaves a meane betweene them both.

CHAP. XXXV.

Olea. The Ollive tree.

THe Ollive is diſtinguiſhed into the tame or manured Ollive, and into the wild ſort: for although the old Writers, as *Pliny*, *Columella*, and others ſet downe ten ſorts, which they called by ſeverall names, which whether it were in theſe as in the diverſities of Vines, wee know not our climate not fitting their growing, or according to Wines, which according to the ſeverall climates and ſoyles, gave ſweeter or harſher, weaker or ſtronger Wine, one then another, and ſo greater or leſſer Ollives, and ſweeter or ſtronger oyle one then another: for divers doe account them to be differing in *ſpecie*, one from another, as our Apples, Peares, and Cherries doe.

1. *Olea ſativa.* The manured Olive tree.

The manured Ollive tree riſeth in ſome place to be very tall, and very great, like a great Wallnut tree, in others not of halfe that height and greatneſſe, with divers armes and branches not very thickely ſet together, whereon grow ſomewhat long and narrow leaves like the Willowes but leſſer, and ſhorter, thicke, fat, and ſharpe pointed with ſhort footeſtalkes under them, greeniſh above and whitiſh underneath, never falling off the tree, of a bitter taſte and ſomewhat ſharpe withall: the bloſſomes are many ſet together at the joynts with the leaves, ſmall and of a greeniſh white colour, made of foure leaves a peece, after which come round and ſomewhat long Cherries, greene at the firſt, and changing pale afterwards, and then purpliſh, and laſtly, when they are full ripe, of a deepe blacke, and ſome white when they are ripe, as *Cluſius* ſaith he obſerved: ſome are great others are ſmall, and ſome of a meane ſize betweene both, ſome are longer, and ſome rounder then others, ſome are fitter to eate, and yeeld not much oyle, others are not ſo fit to eate, and are ſmaller, yeelding more ſtore of oyle, ſome againe are gathered unripe and pickled up in brine, (which are the Ollives we uſe to eate with meate) others are ſuffered to grow ripe, and then pickled or dryed, and kept all the yeare, to be eaten as every one liſt: Of thoſe Ollives whereof oyle is made, ſome oyle will be delicate ſweete and neate, others more fatty or full and ſtrong, ſome upon the taſte will leave no bitterneſſe or heate in the mouth, but will taſte as ſweete as butter, others againe will be more or leſſe hot and unpleaſant in taſte, the wood is faire, firme, and ſolid full of curld veines, and as apt to burne when it is greene as dry, and will not rot in a long time.

2. *Oleaſter ſeve Olea ſylveſtris.* The wild Ollive trēe.

This wilde Ollive tree groweth ſomewhat like unto the manured, but that it hath harder and ſmaller leaves, and thicker ſet on the branches, with ſundry ſharpe thornes among the leaves: the bloſſomes and fruite come forth

1. *Olea ſativa.* The manured Ollive tree. 2. *Olea ſylveſtris.* The wilde Ollive tree.

forth in the ſame manner that the other doe, and in as great plenty, yet much leſſer, and ſcarſe comming at any time to ripeneſſe even in the naturall places, but where they doe being ripe, they are ſmall with crooked pointes and blacke: Of the Ollives hereof is ſometimes made oyle, which is colder and more aſtringent in property then the other and harſher in taſte, and greeniſh in colour, but the Ollives are much alſo reſpected and gathered to be eaten.

The Place and *Time.*

Both theſe grow in the warmer Countries onely, neither will they beare fruite in any cold climate, or rather ſcarſe live out their Winters: the manured as I ſaid before is wholly planted whereſoever it groweth, where according to the ſoyle and climate come greater or leſſer Ollives, and more or leſſe ſtore, ſweeter oyle alſo, or more ſtrong in taſte. Many doe thinke ſaith *Columella*, that the Ollive tree will not grow, or at the leaſt not beare fruite if it doe grow, above three ſcore miles from the Sea. For from the Iſles in the Mediterranean Sea, as *Zante* and *Cerigo*, &c. is brought the fineſt and ſweeteſt oyle, and from *Majorca*, &c. a fuller or fatter oyle; from *Provine* in *France* a ſtronger and hotter taſted oyle, then either of them or ſome others: the wilde Ollive groweth naturally in *Spaine*, *Portugall*, *Italy*, and many other Countries. They flower in *June* and *July*, and have not their fruite ripe untill *November*, or *December*, and as *Cluſius* in *Granado* not untill *February*, the wilde in *January* and after. *Virgil* ſheweth in theſe Verſes that the Ollive being planted needeth no further dreſſing.

Non ulla eſt Olivis cultura, neque illæ
Procurvam expectant falcem, raſtroſque tenaces,
Cum ſemel hæſerunt arvis, aut raſque tulerunt.

The Names.

The manured Ollive is called in Greeke ἐλαία ἥμερος, and *Olea ſativa* in Latine, the wilde Ollive ἀγριελαία, κότινος and διόσμικὴ ἐλαία, that is in Latine, *Oleaſter*, or *Olea ſylveſtris Cotinus*, and *Olea Æthiopica*, as *Dioſcorides* hath it: the fruite is called ἐλαία, and *Oliva* in Greeke and Latine, and when they are neere ripe *Drupæ*, and *Drupetes*, and *Colymbades* when they are pickled or dryed to be eaten, yet the Greekes at this day call them *Dermatia*. The manner to make Oyle as *Matthiolus* relateth is thus: after the Ollives are gathered they are laid a little to wither, and afterwards ground in a Mill, and then put into a ſtrong preſſe, with ſome hot water powred on them to yeelde out the oyle, which after it hath ſtood and is ſettled, the pure oyle is drawne off from the foote or bottome and kept for uſe. The manner to pickle Ollives to have them keepe their greene colour, is ſaith *Matthiolus*, to take ſix pound of quicke Limeſtones made into pouther, which diſſolved in ſo much water as may make it thinne, you are to put thereto twelve pounds of fine ſifted Oke aſhes, diſſolved in as much water as will be ſufficient, into which you are to put 25. pounds of freſh gathered greene Ollives, and let them lye therein eight or ten houres at the moſt, to take out their bitterneſſe, ſtirring them a little, and afterwards waſhed in many waters, ſhifted for five dayes together, which are laſtly to be put into brine or pickle, wherein ſome Fennell ſtalkes and leaves have beene put into the boyling, and then put up into woodden or earthen veſſels, as you liſt. The foote of the oyle is called *Amurca* in Latine. The gum ſaith *Dioſcorides*, that the *Ethiopian* or wilde Ollive doth yeelde, is yellow, ſomewhat like unto *Scammony*, being in ſmall droppes, and is hot or ſharpe, biting upon the

tongue: but that saith he, which is blackish resembling *Gum Ammoniacum*, or other gum, and burneth not upon the tongue, is adulterate and false, but saith *Matthiolus*, this gum is neither brought us now adayes, nor is in use: yet some thinke that our Gum *Elemi* is it, but therein saith he they are much deceived, in that it hath no biting taste in it, and besides it is more like unto a Rosen that will melt with the fire, then a Gum which will burne in the fire, and will not be dissolved without wine or vinegar, or other such liquor. The *Arabians* call the manured Ollive *Zarton* and *Carton*, the *Italians Olivo domestico*, the *Spaniards Olivo* and *Azeytuno*, the *French Olivier*, the *Germanes Oelbaum* and *Olivebaum*, the *Dutch Oliveboom*, and we the tame or manured Olive tree: the wilde Ollive is called by the *Italians Oliva salvatica*, by the *Spaniards Azebache*, and *Azuche*, by the *French Olivier sauvage*. And we in *English* the wild Ollive tree.

The Vertues.

The greene leaves and branches of the Ollive, but much more of the wilde Ollive doe coole and binde, especially the juyce with vinegar, all hot Impostumes inflammations and swellings, Saint *Anthonies* fire, fretting and creeping ulcers, cankers in the flesh or mouth: the same also restraineth the bleeding of wounds, and womens too abounding courses, being applyed to the places: the said juyce dropped into the eyes, stayeth the destillations of hot rheumes into them, and cleereth the sight from filmes or cloudes that dimme the sight, and any ulcer that doth breede therein, or ulcers that breede in the eares. The pickled Ollives doe stirre up an appetite to meate, and although hard of digestion, yet pleasing to the stomacke, being apt to putrefie therein, are not good for the eyesight and breede headache, yet if they be dryed and applyed to fretting or corrhoding ulcers, doth stay them, and taketh away the scarres of carbuncles or plague sores: the pickled Ollives burned, beaten and applyed unto wheales, stay their further encrease, and hinder them from rising and cleanse foule ulcers, helpeth the gums that are loose and spongy, and fasteneth loose teeth. The water that is taken from the greene wood, when it is heated in the fire, healeth the scurfe and scabbes in the head or other parts: the Olive stones being burned are used for the said purposes, and also to stay foule spreading ulcers, and being mixed with fat and meale, they take away the ruggednesse of the nailes. Now to speake of the other parts of the Ollive, which are the oyle and the foote thereof: first the oyle is of divers variable properties, according to the ripenesse or unripenesse of the fruite, whereof it is made, and then of the time and age thereof, and lastly of the washing therewith some is made, the oyle that is made of unripe Ollives, is more cooling and binding then that which is made of them when they are ripe: which when it is fresh or new is moderately heating and moistening, but if it be old it hath a stronger power to warme and to discusse, which properties are perceived by the sweetenesse, for if the oyle be harsh, it is more cooling then warming: and if that oyle be washed it taketh from it all harshnesse. The greene oyle of unripe Ollives while it is fresh, is most welcome to the stomacke, it strengtheneth the gums, and fasteneth the teeth, if it be held in the mouth for any time, and being drunke it hindereth their much sweating that are given thereunto: the sweete oyle is of most use in Sallets and meates, being most pleasing to the taste, but the older the oyle is, the better it is for medicines, both to warme any part, and to discusse any thing that needeth it, and to open and moove the belly downewards, and is most effectuall against all poysons, especially those that doe exulcerate the guts, or not being passed downe so low, but yet abiding in the stomacke, it bringeth it up by vomitting, or hindereth the malignity, from further spreading: it is also a principall ingredient into all salves almost, helping as well the forme, as the vertue in working. The foote or dregges of oyle, the older it is the better it is for divers purposes, as to heale the scabbe in man or beast, being used with the decoction of Lupines: it is very profitably used for the ulcers of the fundament or privy parts, with honey wine and vinegar, it healeth wounds, and helpeth the toothache, being held in the mouth, if it be boyled in a copper vessell unto the thickenesse of honey, it bindeth much and is effectuall to all the purposes for which *Lycium* may be used: but if it be boyled with the juyce of unripe grapes to the thicknesse of honey, and applyed unto aking or corrupt teeth, it will cause them to fall out: if this foote or dregges of oyle be put into that morter that shall parget the walles or floores of your Wardrobs, where you meane to lay any woollen or silken stuffes or garments, in chestes or presses, it will not onely preserve the places dry, from gathering moisture, but warme also from over much cold, and will keepe away mothes, wormes, spiders, and flyes, nor will suffer any to breede therein. The gumme of the Ollive tree (whether tame or wilde) is used in ocular medicines to helpe the dimnesse of the eyes: the same also provoketh urine and womens courses, and helpeth the paines of hollow teeth: it causeth aborsement, it expelleth the dead childe, and healeth tetters, ring wormes, scabbes and lepry.

Chap. XXXVI.

Oleaster Cappadocicus. The bastard or sweete wilde Ollive.

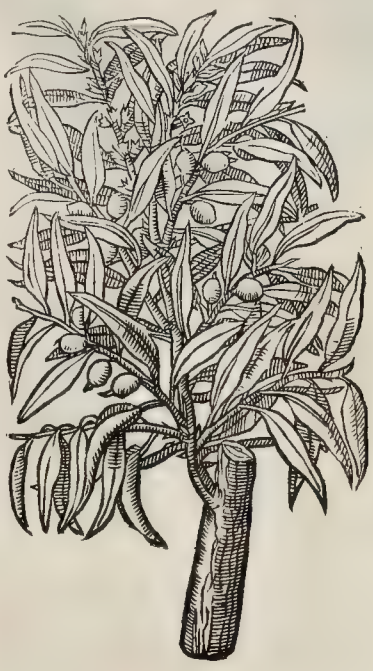
THe bastard wilde Ollive, (and why I so call it I will shew you by and by) groweth by time to be a great tree, and well spread, whose barke is very rugged on the body, but smooth and whitish on the armes, which have very strong and sharpe thornes on them, the younger branches having none: the leaves are set on both sides of them without order, long and narrow, very like unto Willow leaves, but thicker, softer, and whiter, both the upper and under side, which encline to a silver shining colour: the flowers grow at the foote of the leaves, being small and of a pale white colour, very sweete and somewhat strong, smelling even a farre of: after the flowers are falne, come round and somewhat long white berries, like unto small Ollive berries, with a point at the ends like unto thornes, with a sweete soft and spungy substance somewhat like a plumme, or the red *Iujube* fruite, having a chanelled hard stone, like an Ollive stone in the middle: but *Lugdunensis* saith the berry is as dry, and without substance as the Hawthorne, which peradventure is so in those places neere him, but in the warmer Countries may be such as I have described them, from good Authours that have seene them to be such.

The Place and *Time.*

This groweth as *Bellonius* saith in divers places in *Turkie*, as he saw in his travailes through their Countries, and in the hedges of *Granado* in *Spaine*, as *Clusius* observed, and in most Orchards of note in *France*, *Germany*, and other

other places with us also: and flowreth in the beginning of Summer in the warmer Countries, but very late with us the fruite ripeneth in Autumne in *Spaine*, &c. but seldome with us, yet *Matthiolus* saith, hee saw fruite on the tree that grew in the Emperours Orchard in *Vienna*.

Oleaster Lugdunensis.
The bastard or Sweete wilde Olive.



The Names.

This tree is diversly taken by divers learned Writers, for *Matthiolus* calleth it *Olea Bohemica*, and taketh it to be *Eleagnus* of *Theophrastus*, because the name being deduced from *Olea* and *Agnus*, the Ollive and the Chaste tree, as like unto them both, this having leaves and branches like the Chaste tree, and berries like the Ollives: but that it cannot be *Eleagnus*, let me shew you that this is a great tree. *Theophrastus* saith it is *fruticosa planta*, a shrubby plant, and againe, he saith the flower of the white Poplar which all know, doth grow in spiked heads not scatteringly on the branches, and lastly he saith, it beareth no fruit, and this is plentifull in any of those places, where *Theophrastus* chiefly gathered his knowledge of this and other Plants, and therefore as *Theophrastus* saith, being so like unto the kindes of Willowes, it is most probable to a kinde of Willow, which are thought to beare no seede or fruite, and therefore *Amatus Lusitanus* would make it to be *Salix Amerina*, without any good ground or reason. *Bellonius*, *Clusius*, and *Camerarius* call it *Ziziphus alba Columellæ*, whereunto it is very like: *Gesner* also in *hortis* so calling it, and *Oleastri species quibusdam* also: *Bellonius*, *Dodonæus*, and *Lugdunenses*, take it to be the *Ziziphus Cappadocica Plinij*. which it is very probable to be also, *Lobel* calleth it *Olea sylvestris Septentrionalium*, and *Æleagnus* also, and some likewise *Olea Germanica*, but in my opinion *Lobel* and *Bauhinus*, and those in *Gesners* time do come neerest unto the name, whereby it may be most truely called *Olea sylvestris* or *Oleaster*, which I have followed and added *Cappadocicus*, because that in leafe it doth more neerely resemble the Ollive tree, then the *Iujube*, and that it is more naturall to be of *Cappadocia* then *Bohemia*, or any of these Northerly Regions: some also call it *Arbor Paradisea*, and some *Thuia odorata*, and some take it to be the *Barbâ Iovis* of *Pliny lib. 6. c. 18.* *Rauwolfius* saith it is called in *Syria Seisefan*.

The Vertues.

We have no especiall Physicall property allotted unto this tree, or the fruite, but that as *Bellonius* and *Clusius* have recorded, the fruite is eaten by the people where they grow, with delight and pleasure, and without any offensive quality. The flowers as *Lugdunensis* sheweth might be employed to perfume gloves, or garments, or to be distilled into a sweete water as well as the flowers of *Calef.* which *Bellunensis* tooke to be this tree, and are used in the manner aforesaid.

CHAP. XXXVII.

Oenoplia spinosa & non spinosa sive Napeca sive Ziziphus alba.
The white *Iujube* tree, with thornes and without.

IN regard that this tree doth so peere resemble the other *Iujube* tree, mentioned here before in this Worke, I might have joyned them together, but that I could not assure it you to be of the same property, I have therefore reserved it for this place, as partly partaking with the Ollive as the Iujube tree, and is of two sorts, the one bearing thornes, and the other none, in all other things so like, that one description may serve them both. It groweth to be a tree as great as a meane sised Peare-tree, whose body and branches are covered with a whitish ash-coloured barke, full of small short and sharpe prickes or thornes, two set at each leafe not farre in sunder, in the one sort, and without any in the other: the leaves are somewhat broad and short, very like to the leaves of the other Iujube tree but greater, round pointed for the most part, with three ribbes in each, running all the length, of a darke shining greene colour on the upper side, and somewhat tending to an ash-colour underneath, standing singly at the branches, one on this side and another on that up to the toppe; at the joynts with the leaves come forth divers small greenish white flowers, like the blossomes of the Ollive or Iujube tree for the forme, each standing on its owne small footestalke, after which being falne come many small round fruite, as bigge as a great Cherry, yet sometimes as great as a Wall-nut, in some whitish, in others more yellow, and reddish on the one side like an Apple, of a very sweete taste, with a stone in the middle thereof, like an Ollive stone, but round and not long.

spinosa & non spinosa

The Place and Time.

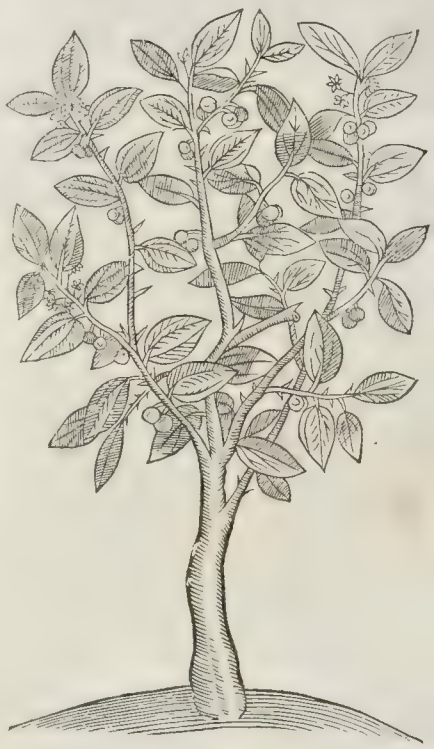
These grow in *Syria*, *Egipt*, *Arabia*, and the parts neere unto them, where they hold their greene leaves all the

Winter without falling, but in *Candy*, and other the hether parts, they have beene obſerved to fall off, as other trees doe: they beare in the warmer Countries twiſe a yeare, yet the former fruite that commeth in the Spring of the yeare, ſeldome commeth to maturity, becauſe the moiſture of the time ſpoyleth them, that they doe not ripen kindly, but in the Autumne the fruite is ripe and delicate.

The Names.

That ſort which is without thornes is deſcribed by *Alpinus* in his Booke of *Egiptian* plants, who calleth it *Nabca Palmrus Athenæi credita*, and very truely for *Athenæus* in the foureteenth Booke of *Deipnoſophiſtes*, calleth it *Paliurus*, and ſaith that *Agathocles*, in the third Booke of his Hiſtory, deſcribeth it by the name of *Connarus*, as thoſe of *Alexandria* called it, and by *Honorius Bellus* that ſent the fruite to *Cluſius*, as it is ſet downe in his fifth Epiſtle to him called *Oenoplia ſpinoſa*. That without thorne is ſet forth by *Cluſius*, in his Hiſtory of plants; as he received it alſo from *Honorius Bellus* of *Candy*, who calleth it *Oenoplia ſeu Napeca Belloni Connarus Alexandrinorum forte Athenæi*: *Serapio* comprehendeth them both under the name of *Sadar* or *Sudar*, but as his manner is in other things, he confoundeth it with the *Lotus* of *Dioſcorides*, from which it much differeth, it is called in *Syria* and *Egipt*, *Nep* and *Nap*, and as *Guilandinus* ſaith, put by many among the ſorts of *Iujubes*. But *Pliny* ſeemeth to call it *Prunus Ægyptiaca*, an *Egyptian* Plumme.

Napeca Nabca aut Oenoplia ſpinoſa.
The white Iujube tree with thornes.



The Vertues.

The fruite of both theſe before they are ripe, are cold and dry in the firſt degree and binding, but when they are ripe they have ſome moiſture in them, and are much uſed to ſtrengthen the looſeneſſe of the ſtomacke and belly, by the juyce of them being taken at the mouth or given in a gliſter: the dryed fruit infuſed in water, and the infuſion taken, is profitable againſt the ſlipperineſſe and ulcers of the bowels, the decoction or infuſion of the ripe fruite, being dryed is of great uſe againſt peſtilentiall feavers, for the fruite is held to have a wonderfull property againſt venomous qualities, and to reſiſt putrefaction, and mightily to ſtrengthen the heart: the juyce of the fruite when it is throughly ripe, is very good to purge choller from the ſtomacke, and the firſt conduits of the veines: as alſo in all putride feavers, an infuſion of them is familiarly taken to coole the heate and violence thereof.

Chap. XXXVIII.

Azadarach Avicennæ. The Bead tree.

Although this tree be in forme much differing from any of the laſt ſorts, yet becauſe ſome have called it *Zizyphus*, as they did the laſt ſaye one, I thought it not amiſſe to inſert it in this place, whoſe deſcription is on this manner. It groweth to be high and vaſt, ſpreading far and making a goodly ſhadow in the warme Countries where it beſt proſpereth, the body and greater boughes are covered with a rugged barke and full of chinkes, but that on the youuger branches is ſmooth ſomewhat like unto thoſe of the Figge: the leaves are very largely ſpread and winged, having long footeſtalkes, ſomewhat like unto Aſhen leaves, but larger, more ſpread and of a darke greene colour, dented about the edges, the end leafe being longeſt, yet in ſome places they are not ſo largely ſpread, from the foote whereof come forth long ſtalkes, bearing ſundry blewiſh flowers laid open, with five ſmall narrow leaves like a ſtarre, and a ſmall hollow cup more purple in the middle, after which come round fruite, of the bigneſſe of a Cherry, greene at the firſt, and white when it is ripe, of a ſweetiſh taſte at the firſt, but after very bitter, unpleaſant, loathſome, and ſtinking, containing a ſtone within it fixe ſquare, ſomewhat like unto the *Emblick Myrabolane* ſtone, with two kernels within each, from whence uſually riſe two ſproures or ſtalkes of greene leaves, the fruite being drilled (which will be eaſily done, not being very hard) and drawne on ſtringes, ſerve people beyond Sea to number their prayers on, leaſt they forget themſelves and give God too many: this looſeth all his leaves in Winter, freſh ariſing in the Spring.

The Place and Time.

This groweth in none of theſe Chriſtian Countries naturally, but are all planted whereſoever they grow, in Orchards or Court yards, for the ſhadow ſake, being of little uſe beſide, *Cluſius* ſaith he ſaw divers of them in *Spaine*, and heard they were more frequent in *Italy*, it flowreth in *June*, and the fruite is ripe in *September*.

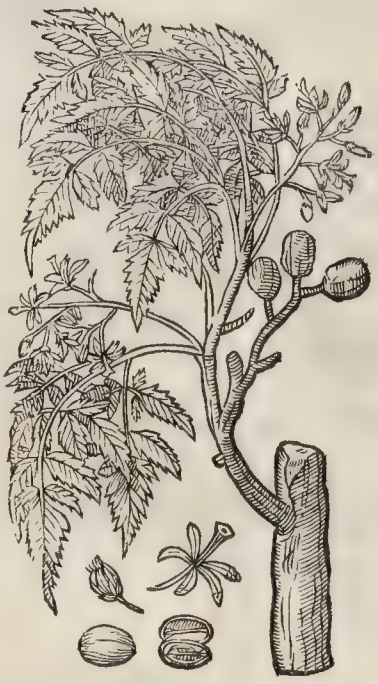
The Names.

This was called *Ziziphus candida*, by the Herbarists at *Mompelier* as *Lobel* saith, and *Sycomorus* by *Italians*, as *Matthiolus* saith, but misliking that title he called it *Pseudosycomorus*, yet in other places of *Italy* it is still called *Perlaro*. *Cordus*, *Gesner* in *hortis*, and *Bellonius* call it *Sycomorus Italorum*, *Lugdunensis* setteth it downe by the name of *Ziziphus alba*. *Gesner* saith some learned men called it *Myxus alba & Laurus Græca Plinij*. *Cæsalpinus* tooke it to be *Tuber candida*, of *Pliny*, and peradventure *Zizipha Columellæ*, *Dodoneus* hath it under the name of *Azadarach*, and so have *Clusius* and *Camerarius*, some *Turkes* in these dayes call it *Thespic*, and *Rauwolfius* saith that they of *Tripoli* call it *Zenselacht*, but generally now adayes, with most *Azadarach* or *Asederaeth*, yet the *French* call it *Arbor sancta*, because as is before shewed, the fruite helpeth their devotions, as the *Spaniards* doe, that call it *Arbol paraysо*.

The Vertues.

The best use that this serveth for is, that the distilled water thereof will kill Lice, and causeth the haire to grow faire and long, if it bee mixed with white Wine, and the headed washed therewith, the fruite is dangerous if not deadly, if it bee eaten causing the like Symptomes that the Oleander doth, and is to be remedyed with the same helpes: *Rauwolfius* saith, that it will kill dogges, if it bee given them with their meate.

Azadaraeth herbariorum.
The Bead tree.



CHAP. XXXIX.

Phillyrea. Mocke Privet.

OF this kinde of shrub there are foure or five sorts each differing from other in the broadnesse or narrownesse of their leaves especially, as you shall heare.

1. *Phillyrea latifolia aculeata.* Prickely mocke Privet.

This first Mocke Privet riseth up with sundry stemmes, of the thickenesse of ones thumbe, covered with a greenish barke spotted with white: the leaves are set by couples at the joynts, all along the branches, which are somewhat thicke, hard, and prickely, dented about the edges very like the leaves of the Scarlet Oke bush but greater: the flowers come forth at the joynts of the leaves, the fruite is small, and blacke round berries hanging downe about the branches, and are like unto the berries of Privet, or of the Masticke tree, but having a small stone within them.

2. *Phillyrea folio lato serrato.* Toothed Mocke Privet.

This other Mocke Privet groweth greater and higher, whose branches are covered with a whitish barke, having somewhat broad and hard blackish green leaves, pointed at the ends and dented about the edges, two alwayes set at a joynt, of a little sharpe and bitter taste. The flowers grow at the joynts with the leaves, as in the former, and the berries that follow are blacke and round like Pepper or Mirtle berries, with a thin brittle shield stone within it.

3. *Phillyrea latifolia folus fere non serratis.* The greater Mocke Privet with lesse dented leaves.

This Mocke Privet groweth lower then the last, yet unto two mens height, with a whitish barke covering the branches as in the last, but somewhat more rugged. The leaves are set on the branches in the same manner as the former, but somewhat narrower, and but seldome dented at al about the edges, the flowers are of a whitish green colour, standing thicke together, about the setting on of the leaves, somewhat like unto the Ollive blossomes, after which come round berries like the last.

4. *Phillyrea angustifolia prima.* The first narrow leafed Mocke Privet.

This is a low bush not exceeding a mans height, but fuller of branches, yet smaller then the last, and covered with a blacker barke: the leaves are narrower and greener then it, like unto the wild Ollive, and not without some bitternesse in them: the flowers are white and grow after the same fashion, thicke set together, unto which being falne succeede blacke round berries like unto Mirtle berries, with a hard stone in them.

5. *Phillyrea angustifolia secunda.* The other narrow leafed Mocke Privet.

This other Mocke Privet shooteth forth many more suckers from the roote, which are slenderer and not very

easie

1. *Phillyrea latifolia aculeata,*
Prickely Mocke Privet.

4. *Phillyrea anguſtifolia prima.*
The firſt narrow leafed Mocke Privet.

2. 3. 5. *Phillyfolio lato ſerrato, & fere non ſerrato, & anguſtifolia ſecundas.* Toothed Mocke Privet, and with leſſe dented leaves, and the other narrow leafed Mock Privet

eaſie to breake, nor ſo plentifull or thicke growing as the former, with leaves ſet one againſt another, narrower, longer, and of a darker greene colour, this was ſaid to beare neither flower nor ſeede, which matter is diſproved, and found to beare both, and like unto the laſt.

The Place and *Time.*

Cluſius obſerved theſe five ſorts in *Spaine, Portugall,* and *France.* They flower in the Spring, and their berries are not ripe untill it be very late in the yeare.

The Names.

Divers learned men did take the φιλύρεα *Phillyra* of *Theophraſtus,* which we have ſhewed you to be the Line tree, to be this φιλυρέα *Phillyrea* of *Dioſcorides,* being deceived by the vicinity of the names untill *Cordus,* who better conſidered them, found them much to differ, as well in forme as in properties, ſince whoſe time all that have followed him have ſo accounted of them. *Lobel* ſaith, he would rather read it φιλαελαΐα or *Olea amaſia,* a kinde of wilde Ollive, whereunto it is moſt like, or little differing: The firſt is the firſt *Phillyrea* deſcribed by *Cluſius,* and ſo is my ſecond his ſecond *Phillyrea* alſo: The third is the firſt *Phillyrea* of *Matthiolus* and *Lobel,* and the third with *Cluſius,* and is the *Phillyrea* of *Bellonius,* and *Geſner in hortis, Dodonæus* calleth it *Cyprus latiore folio,* and *Lugdunenſis Alaternus major Dalechampij,* and of *Cæſalpinus Ilatrum,* and *Phillyra* of *Theophraſtus, Bauhinus* calleth it *Phillyrea folio Liguſtri.* The fourth is the fourth *Phillyrea* of *Cluſius,* the *Phillyrea anguſtifolia* of *Lobel,* the *Alaternus minor Dalechampij* of *Lugdunenſis,* and the *Cyprus* of *Dodonæus.* The laſt is *Cluſius* his fifth *Phillyrea* alſo, and both theſe laſt are called by *Lobel, Narbonenſis.*

The Vertues.

The leaves of this Mocke Privet are binding, as *Dioſcorides* ſaith, and are of the ſame effect that the wilde Ollive

tree

tree leaves are, and used in decoctions are good against the ulcers in the mouth or to wash the teeth, the same also being drunke provoketh urine and womens courses.

CHAP. XL.

Alaternus sive Philyca Theophrasti credita. Ever greene Privet.

THere is so great affinity betweene the former Mocke Privet, and this ever greene Privet, that divers good Authours call the one by the others name, as you have in part heard in the former Chapter, and shall more in this, whereof there are two sorts a greater and a lesse.

1. *Alaternus major seu prior.* The greater ever greene Privet.

The former of these two shrubs, groweth sometimes tall like a tree, with long but not any great branches, nor yet much divided into lesser ones, and are covered with a whitish greene bark, and with another yellowish one under it, or more inward, whereon grow somewhat broad leaves without any order, of a meane size betweene the Ollive, and the ever greene Oke, but thicker, and slightly dented about the edges, and of a darke greene colour, of an unpleasant taste, and bitterish withall, the flowers are many tufting together at the setting to of the leaves, and are of a whitish greene colour, there hath not beene any fruite observed to follow them.

2. *Alaternus minor seu alter.* The lesser ever greene Privet.

This other groweth lower by much, with a whitish greene reddish barke mingled, the leaves are lesser, rounder, and dented about the edges, and of a paler greene colour, the flowers are greater and greener, set together like the former, unto which succeede small round berries, greene at the first, reddish afterwaards, and blackish when they are ripe, having three stones or seedes within each of them.

The Place and *Time.*

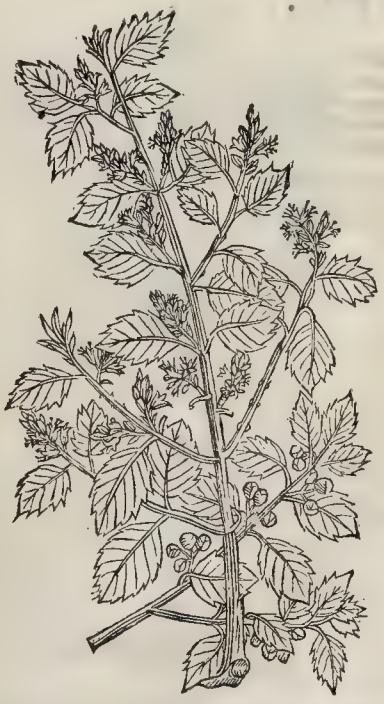
Both these were observed by *Clusius* in *Spaine* and *Portugall.* They flower there in their naturall place in *February*, and the fruite is ripe in *May.*

The Names.

Pliny calleth this *Alaternus quasi inter Oleum & Ilicem media*, *Belloníus* in his first booke of Observations and 42 Chapter saith, that there is none in mount *Athos* but knoweth the true name of that tree, that *Pliny* calleth *Alaternus*, to be the *Philyca* of *Theophrastus*, but those of *Corcyra* and *Candy*, call it ἐλαιόπρινον *Elæprinus.* It is the first *Alaternus* of *Clusius*, and the *Alaternus Pliny* of *Lobel*, *Cæsalpinus* as *Bauhinus* saith, but I thinke rather it should be *Lugdunensis*, calleth it *Celastrus mas Theophrasti*, and *Cæsalpinus Phillyra mas Theophrasti*: *Lugdunensis* taketh it to be *Aphaca Theophrasti*, which they of *Mompelier* call, as saith *Lobel*, *Bourgeſpine* some also call it *Phi-*

1. *Alaternus major.* The greater ever greene Privet.

2. *Alaternus minor.* The lesser ever greene Privet.



Lyrea,

lyrea. The other is called by *Clusius Alaternus alter*, by *Lugdunensis Celastrus famina Theophrasti*, and both of them *Phillyrea* by *Bauhine*, not giving any peculiar title to *Alaternus*, it is likewise the *Vaccinium Plinij*, and *Lycatha Theophrasti*, as *Lugdunensis* taketh it some read *Lacara*, who saith it differeth much from all the other sorts of wilde Cherries, both in the forme of the leaves, bitternesse of the fruite, &c. and *Ilatrum folio ad Ilicem accedente* by *Caesalpinus*, from the word *Ilatro*, whereby the *Italians* of *Lucca* call it as *Clusius* saith, but *Anguilara* saith *Alaterno*, and *Linterno*, as *Bourgesme* is by the *French* as *Lobel* saith, and yet I finde that name given to many other plants, but *Dalechamp* and *Sanguinolente*, as *Bellonius* saith, for as *Clusius* saith, the *Portugalls* call the first *Caseca*, and the other *Filiguero*, and *Sanguentio*.

The Vertues.

Theophrastus saith that *Phillyrea* hath the priority to feede sheepe in that it is ever greene: And *Clusius* saith that the *Portugals* use the barke to dye their nets into a red colour, and with the chips of the wood whereof are whereof they dye a blackish blew colour.

CHAP. XLI.

Ligustrum. Privet.

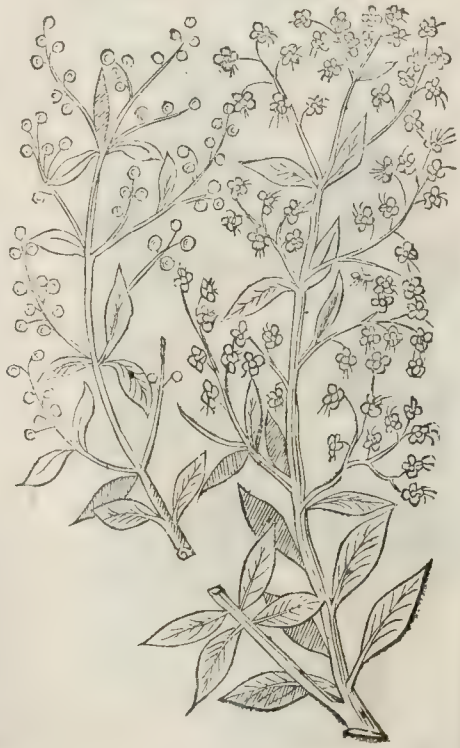
BEcause our Privet hath beene so often mistaken by many for the *Cyprus* of *Dioscorides*, *Pliny* being the first Authour of the errour, who although *lib.* 12. *c.* 25. he saith that *Cyprus* is a tree that groweth in *Egipt*, with a white sweete flower, and Coriander like seede, yet presently after he saith, that some take this to be the same, which is called *Ligustrum* in *Italy*, and *lib.* 24. *c.* 10. hee saith plainely that *Ligustrum* is the same tree that *Cyprus* is in the East. I thinke it fit to joyne that *Cyprus* of the East in this Chapter with the other sorts of Privet that you may plainely know the diversity, and that all further controverties may cease.

1. *Ligustrum vulgare.* Our common Privet.

Our common Privet groweth not into any great bodyed tree, but yet it is carryed up with the many slender branches to a reasonable height and breadth to cover Arbours, Bowres, and Banquetting houses, and wrought wrought and cut into many formes of men, horses, birdes, &c. as the workeman list supported at the first with timber, poles, and the like, but afterwards groweth strong of it selfe, sufficient to hold it in the forme it is made into: it beareth long and narrow darke greene leaves by couples, and sweete smelling white flowers in tufts at the

1. *Ligustrum vulgare.*
Our common Privet.

3. *Ligustrum Orientale sive Cyprus Dioscoridis & Plinij.*
The Easterne ever greene Privet.



ends

ends of the branches, which turne into ſmall blacke berries that have a purpliſh juyce within them, and ſome ſeedes that are flat on the one ſide with a hole or dent therein. *Tragus* ſaith that there is ſome found that beareth a yellow flower, but is very rare to finde differing in nothing elſe, which peradventure may be that other ſort that *Lonicerus* calleth *minus*. *Alterum minus flore ſubluteo.*

2. *Liguſtrum myrtifolium Italicum.* The *Italian* Mirtleleafed Privet.

This groweth in the ſame manner that the former doth, and ſpreading into branches that are round and ſomewhat reddiſh, the leaves are both longer and broader, comming neere unto the greateſt Mirtle leaves, and of a darke greene colour.

3. *Liguſtrum Orientale ſive Cyprus Dioſcoridis & Plinij.* The Eaſterne ever greene Privet.

This Eaſt Country Privet, if it be ſuffered to grow at large without pruining, groweth to be as great as the Pomegarnet tree, whoſe body and branches are covered with a whitiſh aſh-coloured barke: the leaves are ſomewhat like unto thoſe of the former common Privet, but whiter, broader and more pointed, growing many ſet on both ſides of a ſtalke below, but ſingly up to the toppe at the joynts among the branches of flowers, which grow in a looſe tuft, ſomewhat ſparſedly, conſiſting of foure ſmall grayiſh aſh-coloured leaves, of a very ſharpe and quicke ſent, farre beyond the Privet flowers, after which ſucceede ſmall round and white heads, ſomewhat like unto Coriander ſeede, with three or foure blackiſh ſeedes within them: the leaves fall not of in Winter as our Privet doe, but abide on freſh all the Winter long, of which and the young branches being dryed and ground into pouther, is made a great merchandiſe through all the parts of the *Turkiſh* Empire, and ſome of his bordering neighbours alſo, to give a yellow colour to their haire, hands, nailes, and bodies too, as alſo for their horſes maines and tailes, for the more pompe on feſtivall dayes: of the rootes ſaith *Rauwolfius* being burnt, the *Arabians* make their *Spodium*, whereof *Avicen* ſpeaketh *cap.* 617.

The Place and *Time.*

Our common Privet groweth in our owne Land, in divers woods, the next was ſent from *Padoa* and *Venice*, the laſt groweth in *Egipt* plentifully, in *Tripoli* alſo and *Syria*, in ſundry places: our Privet flowreth in *June* and *July*, the berries are ripe in *Auguſt* and *September*: the laſt flowreth late even in the warme countries, and the ſeede ripeneth accordingly: the other hath not as yet beene diſcerned ſo exactly.

The Names.

This our ordinary Privet as I ſaid before, was uſually taken by *Tragus*, *Cordus*, *Ruellius*, *Matthiolus*, *Amatus Luſitanus*, and *Anguilara* who yet doubteth of it, to be the κύπρος *Cyprus* of *Dioſcorides*, which *Pliny* alſo nameth, but *Fuchſius* as I take it, firſt doubted of it, and denyed it to be *Cyprus*, and denyeth alſo that it is certainely knowne by what name the *Liguſtrum* of the Latines was knowne to the Greekes, and therefore *Dodoneus* after *Anguilara*, doe appoint *Phillyrea* to be it: but *Pliny* in ſaying *Liguſtrum* is the ſame tree, that *Cyprus* is in the Eaſt, as is before ſaid, bred this errour in ſo many: but *Cyprus* of *Dioſcorides* is ſaid by him to be a tree, but Privet is not ſo, it is a tree growing in *Egipt* ſaith *Pliny*, the beſt is in *Canope* and *Aſcalone* ſaith *Dioſcorides*, whereby they both judged it to be a ſtrange tree, and not naturall of *Italy*, as *Ligueſtrum* Privet is. It hath ſaith *Dioſcorides* Ollive like leaves but broader, ſofter, and greener, *Pliny* ſaith like Iujube leaves, but Privet leaves are neither broader nor ſofter then the leaves of the Ollive tree, the ſeede ſaid *Pliny*, is like Coriander ſeede, which is meant by the whole ſeede, with the outer huske on it, for the ſeede within them is blacke, as *Dioſcorides* compareth them to the ſeede of the Elder berries: the leaves alſo doe abide alwaies greene, but in Privet they doe not ſo: the leaves ſaith *Dioſcorides* doe give a reddiſh yellow colour to the haire, if they be moiſtned with the juyce of *Struthium* (but not of *Struthei mali* which is the Quince) before it be applyed, but Privet giveth no ſuch colour howſoever uſed: by all which notes it is evident that *Ligueſtrum* and *Cyprus* be different one from the other, and cannot be both one plant, or hereafter to be confounded together as formerly they have beene. The firſt is acknowledged by the name of *Ligueſtrum* by all Writers, although ſome as I ſaid would make it alſo to be *Cyprus* of *Dioſcorides*, and ſome to be *Phillyrea* as is before ſaid. The ſecond *Bauhinus* calleth *Ligueſtrum myrtifolium Italicum*, and ſaith it was ſent him by the name of *Myrtus ligueſtrifolio*. The laſt *Bauhinus* calleth *Ligueſtrum Ægyptiacum latifolium*, becauſe he maketh two ſorts of this one, as he doth in many other things before, making that of *Rauwolfius*, ſet forth in *Bellonius* his Obſervations by *Cluſius*, to be one ſort, and that of *Alpinus* another, entituled *anguſtifolium*, becauſe *Alpinus* his figure (as moſt of his others are) is not ſo exactly drawne, as *Cluſius* ſaith it ſhould be: he ſaith alſo that it is ſet forth in the hiſtory of the Eaſt Indies, *part.* 4. *figura tab* 15. under the name of *Mangoſtans*: but the truth is, they were both entended but for one plant, *Alpinus* ſaith that the *Egiptians* doe now adayes call it *Elhanne*, and *Avicen* with the *Arabians Alcanne* and *Henne*, the Greekes now adayes *Schenna* as *Rauwolfius* ſaith. The *Italians* call the ordinary Privet *Giuſtrico*, *Olivella*, *Olivetta*, and *Chambroſſena*, the *Spaniards Alfena* and *Athena*, the *French Troeſne*, the *Germanes Rheinweyden*, *Beynholtzlin*, and *Mundholtz*, the *Dutch Keelcruyt*, and we in *Engliſh* Prime or Privet, and of ſome Prime print.

The Vertues.

Although our ordinary Privet is little uſed in phyſicke with us in theſe times, more then to be put into lotions to waſh ſores and ſore mouthes, and to coole inflammations and dry up fluxes, yet *Matthiolus* ſaith that Privet ſerveth to all the uſes, for which Cyprus or the Eaſt Privet is appointed by *Dioſcorides* and *Galen*: he further ſaith, that the oyle that is made of the flowers of Privet infuſed therein and ſet in the Sunne, is ſingular good for the inflammations of wounds, and for the headache comming from choller or an hot cauſe: a water alſo that is ſweete is deſtilled from the flowers, that is good for all thoſe diſeaſes that neede cooling and drying, and therefore helpeth all fluxes of the ſtomacke or belly, bloody flixes and womens courſes, if it be either drunke or applyed, as alſo for thoſe that void blood at their mouth, or at any other place, and for deſtillations and rheumes into the eyes, eſpecially if it be uſed with *Tutia*: All theſe properties may ſafely be transferred to the Eaſt Privet, ſaving that it is not of ſo cold a conſtitution, yet as *Galen* ſaith it hath a binding quality from the earthly cold ſubſtance it hath: the young leaves and branches are of a mixt temper, for it hath a digeſting faculty with the warme watery ſubſtance and drying, whereby it helpeth thoſe places that are burnt, and cooleth hot Impoſtumes and ſores, and doth dry without any ſharpeneſſe: the pouther of the leaves ſerve to heale the ſores in the mouth or ſecret parts of man or woman, as alſo to helpe the moiſt ſweatings and ſtinke of the feete, by applying them as a plaiſter mixed up with ſweete wine: the *Oleum Cyprinum*, that is ſweete and made thereof, doth warme and mollifie the nerves and ſinues.

CHAP.

CHAP. XLII.

Celastrus Theophrasti. The Staffe tree.

THis tree groweth up to a meane height, the barke of the body and elder boughes being of a darke colour, and the younger greene, whereon are divers leaves, not greater then those of the fruitelesse Privet, and divers smaller, of a sad greene shining colour on the upper side, and paler underneath, which are little or nothing snipped about the edges, and of a little bitter taste: at the foote of the leaves towards the ends of the youngest branches come forth short stalkes of an inch long, sustaining five or sixe flowers, consisting of foure yellowish greene leaves a peece, which turne into small berries, of the bignesse of Asparagus berries, greene at the first, and as red as the Asparagus afterwards, but growing ripe are very blacke, and somewhat long with the roundnesse, wherein is contained a three square seed, like unto a Grape kernell, whose shell being hard hath as white a firme kernell within it as the hasell nut, covered with a saffron like yellowish skin.

Celastrus Theophrasti. The Staffe tree.

The Place and *Time.*

This grew at *Leiden* in the publike garden, but from whence the naturall place is is not knowne: but from them hath beene communicated unto divers in this Land, as well as in others: the flowers doe often appeare so late that the fruite cannot come to ripenesse, yet it is signified that the first ripe fruite that was seene growing thereon was in *August*.

The Names.

Although *Lugdunensis* referre the κήλαστρον or κήλαστρον of *Theophrastus* (for he hath both words) unto the *Alaternus* of two sorts that *Clusius* hath set forth, as is before shewed you, yet *Clusius* himselfe judgeth this tree to come neerer thereunto, then either of them, and so setteth it downe in his *Curæ posteriores*, some as he saith would make it a kinde of *Laurus Tinus*, but that it cannot be: I doe not find that *Bauhinus* who setteth downe all other mens observations, hath once remembred this plant to referre it to any other, or make it one of it selfe, which is not utuall with him in many other that I know.

The Vertues.

Theophrastus recounteth all the properties hereof, whereunto it is put, and that saith he, is to make staves for old men, no other having made triall of any other facultie it is endued withall.

CHAP. XLIII.

Viburnum. The pliant mealy tree.

Viburnum. The pliant mealy tree.

THis pliant tree hath from a small body, rising to the height of a hedge tree or bush, covered with a darke grayish barke, sundry small (or not great) short, but very tough & pliant branches, of a fingers thicknesse, whose barke is smooth and whitish, whereon grow broad leaves like unto the Elme, but somewhat long and hoary rough, thicke, white like meale, and a little hairy withall, set by couples, finely dented about the edges: at the ends of the branches stand large tufts or clusters of white flowers, which turne into large bunches of round and flat seed like unto Lentils but greater, greene at the first, and red afterwards, but blacke when they are ripe: the branches herof are so tough and strong withall, that they serve better for bands to tye bundels or any other thing withall, or to make wreathes to hold together the gates of their fields, then either withy or any other the like.

The Place and *Time.*

It groweth as a hedge bush, being often cut and plashed by the Countrymen, to spread on the hedges in length to hinder it of the height, and is found very much in *Kent*, and in other shires of the land. And flowreth not until the end of *May*, and ripeneth the fruite in *Septem-*

The

The Names.

Although the signification of *Viburnum*, doth properly entend the young twigge or shoote from the roote of a tree, yet it is not improbable that *Virgil* in citing these verses. *Quantum lenta solent inter Viburna Cupressi*, should meane this tree also, called *Viburnum*, (that it might hold his comparison to the Cypresse, of the meanenes of other Cities unto the statelines of *Rome*) as divers learned men think, which are *Gesner*, *Matthiolus*, *Camerarius*, *Durantes* and *Lugdunensis*, *&c.* and because that the *Italians* in their vulgar tongue, call it *Lantana* (*quod lenti sint rami*) *Guilandinus*, *Gesner*, *Lobel* and *Cæsalpinus*, are content to cal it *Lantana* also, yet *Ruellius* in writing of the *Rhus* of *Theophrastus* and *Dioscorides*, saith he found it without *Paris*, which the Country people called *Blanche putain*, and both he and *Lobel*, doe call it *Viorna Gallorum*, as peradventure derived from *Viburnum*, and yet they call another ramping bush *Viorna* also, which I have shewed you before among the clamberers, to be the *Atragene* of *Theophrastus*, unlesse the *French* have two *Viorna's*, which is doubtfull, for *Ruellius* sheweth a shrub, which he saith the *French* call *Blanche putane*, and is the same they call, saith he, *Viorne* and *Hardeau* also, *Lugdunensis* saith that *Dalechampius* did take this to be the *Speiræa Theophrasti*, because the pliant tough twigges may be writhed (*in spiras*) into wreathes or round circles: but as I shewed you before, *Clusius* setteth forth another *Speiræa*, which he taketh to be the truer. *Cæsalpinus* and *Ruellius*, doe both thinke it to be the *Rhus Theophrasti*, *lib.* 3. *c.* 18 which *Gaza* translateth *Fluida* from the Greeke word ῥοῦς, but as they thinke is no sort of our *Rhus*, or *Sumacke*; because he there describeth it with the leafe of the Elme, but longer, *&c.* and therefore they both referre it to this plant. *Matthiolus* saith, he was also of that opinion, untill having better perused *Theophrastus*, he refused that opinion, acknowledging himselfe to have beene in an errour. The *Italians* as I said, call it *Lantana*, and *Viburno*; the *French Vionne*, as *Ruellius* saith, and *Hardeau* also, from the *French* word *Hard*, which signifieth a band or rope, the *Germanes* call it in some places *Schlingbaum*, but *Tragus* and *Lonicerus*, *Kleiner Malbaum*, *Gerard* calleth it in *English* the Waifaring tree, but I know no travailer doth take either pleasure or profit by it, more then by any other of the hedge trees. I have therefore from *Tragus* his mealy tree, put to the pliantnesse of the twigges and branches, and called it the pliant mealy tree.

The Vertues.

The leaves of this tree are harsh and binding, and are good to strengthen and fasten loose teeth: the decoction of the leaves hereof, and of Ollive leaves together in vinegar and water, is of excellent good use to wash the mouth and throate that are swelled by sharpe rheumes falling into them, it is good also to set the *Vvula* or palate of the mouth into the right place, and to stay rheumes that doe fall upon the jawes: the kernels of the fruite hereof, taken before they are ripe, dryed and made into pouther and drunke, doe stay the loosenesse of the belly, and all other fluxes. Of the rootes being steeped under the ground, and then boyled, and beaten a long time afterward, is made Birdlime, with which Fowlers use to catch smaller birds: the leaves boyled in lye, and the head or haires washed therewith doth keepe them from falling, and will make the haires blacke.

CHAP. XLIV.

Sumach sive Rhus. Sumacke.

THere are three or foure sorts of Sumacke to shew you, three of them of auncient knowledge and use, but one other of later invention: whereunto I must adjoyne another plant, which both for the names sake, and some likenesse thereunto, hath caused divers learned men to intitle it by their name.

1. *Sumach sive Rhus obsoniorum & coriariorum.* Coriars Sumacke.

The Coriars Sumacke in some places riseth to be a reasonable great tree (but in dry barren grounds not above two or three cubits high, or where it is yearely or every other yeare pruined for the profit made of them) spreading sundry branches with large winged leaves, that is many set on both sides of a middle ribbe, each of them dented about the edges, *Theophrastus* compareth them to Elme leaves, but lesser and longer, and *Dioscorides* to the leaves of the *Ilex*: at the ends of the branches come forth large spiked clusters of whitish flowers, which afterwards become reddish, round and flat seede like unto Lentils, with an outward skinny huske, which was, and is yet still in divers places in *Turky*, the condiment or seasoning for meate, being dryed and made into pouther: the wood is whitish, which being dryed and ground serveth to dye blacke withall, as is well knowne to most.

2. *Sumach sive Rhus Virginiana.* *Virginian* Sumacke.

The *Virginian* Sumacke groweth up in some places to be a tree of a meane size whose barke on the body and elder armes is rugged, and of a darke russet colour, those that are two or three yeare old, are smooth and not rugged, but those of the last yeare are of the same brownish red colour and softnesse, that the new velvet head of a deare sheweth to have, (that it might deceive a right good Woodman to see one cut of and presented him on the suddaine, yeelding a yellowish milke, when it is broken or wounded, which in a small time becommeth thicke like unto a gumme: the long winged leaves grow one above another on both sides of the branches very largely spread, having eight or tenne or more long narrow leaves set on each side of a middle ribbe, and one at the end, very smally dented about the edges, of a darke greene shining colour on the upper side, and paler greene underneath: at the ends of the branches come forth long and thicke browne tufts or heads, very soft and woolly in handling, made all of short threds or thrummes, from among which appeare many small flowers much more red or crimson then the tufts, which turne into a number of very red round flattish seede, thicke and close, set on the branches of the head together, lesser then the small Lentils, having a small blackish seede, under that outward skinny huske, whose shell is somewhat hard, enclosing a white kernell within it, the roote spreadeth much under ground, shooting forth suckers round about, and a good way of from the body of the tree.

3. *Rhus Plinij Mirtifolia.* Mirtle leafed Sumacke

The Mirtle leafed Sumacke groweth seldome above the height of a man having many slender branches with leaves set thereon every one of the bignesse of the broad Mirtle leafe, set by couples, but not so closely, or alwayes just opposite one to another, nor so many together, and not dented about the edges: at the ends whereof come

forth many ſmall purpliſh red threds, ſet upon or ſticking out of a ſmall head, one ſet above another, which afterwards turneth into a round and ſomewhat flat creſted blacke berrie, containing therein ſmall white and rough ſeede, ſomewhat like unto Grape kernels. This in ſome places dyeth downe to the ground every yeare, and ſpringeth anew, which is the cauſe it can give no flower, muchleſſe ſeede, which never is found on the firſt yeares ſhoote in our Country, but in other places of our Land ſheweth flowers, ſuch as I have deſcribed, but never any fruite that I can learne.

4. *Coggygria ſive Cotinus Coriaria.*
Venice Sumacke.

The *Venice* Sumacke is in ſome places a tree, riſing to be of the bigneſſe of the Pomegarnet tree, in other places it is much lower, and ſhooteth forth many twigges, of two or three cubits long, and of the bigneſſe of ones finger, divided into many reddiſh branches, having ſundry leaves ſet on both ſides without order, ſomewhat broad, round pointed, thicke, and full of veines, and ſmall red footeſtalkes under them, a little waved about the edges, of a Roſſenlike ſent, not unpleaſant, and of an harſh binding taſte, growing to be of an excellent Roſe colour, in the end of Summer; from the ends of the branches ſtart forth a large and long head, conſiſting of many tufts, of whitiſh greene flowers, ſtanding upon very fine red footeſtalkes, which afterwards ſpread themſelves into ſo many tufts of feather-like haires or threds, having among them ſundry ſmall blackiſh and flat ſeede, formed ſomewhat like unto an heart, which together with the ſilken threds are carried away by the winde: the roote is hard and wooddy, not growing deep nor much ſpreading: the wood is yellowiſh, and ſerveth to give a yellow dye: but the

1. *Rhus obſoniorum & coriariorum.*
Coriars Sumacke.

2. *Rhus Virginianum.*
Virginian Sumacke.

3. *Rhus Plinij Myrtifolia.*
Myrtle leafed Sumacke.

leaves

4. *Coggygria sive Cotinus Coriaria.* Venice Sumacke.

5. *Rhus sylvestris sive Myrtus Brabantica aut Anglica.* Sweete Gaule.

leaves and young branches, doe Dye a blacke colour; and with the barke they Tanne leather, as with the other.

5. *Rhus sylvestris sive Myrtus Brabantica aut Anglica.* Sweete Gaule.

This other plant which as I said is fit to be joyned to the rest, is a small low shrub or wooddy bush, not above a yard high, spreading slender branches; with many browne yellowish greene leaves somewhat long, narrow, thicke and fattish, round pointed, resembling both Boxe and Mirtle leaves in some sort, but smelling somewhat strong and sweete, the flowers are yellow, and stand upon short stalkes, comming forth at the joynts with the leaves in small tufts, many set together, which being past, the said stalkes are plentifully stored with cornered yellowish seede, bedewed with a clammy moisture, of a very bitter unpleasant taste, but strong sweete sent: the roote is hard and wooddy.

The Place and Time.

The first groweth in *Syria* and *Pontus*, as *Galen* saith; in *Italy* and *Spaine* as *Pliny* saith, and in divers other places, where it is manured as carefully as their Vines, and as *Clusius* saith he saw it so ordered in *Spaine*, which yeelded the Owners great profit, the second groweth naturally in *Virginia*, from whence we had it. The third about *Mompelier*, and in sundry other places. The fourth in *Savoy*, and on the *Appenine* hils and elsewhere. The last groweth in many places of our owne Land, as well as beyond the Sea, as in *Sussex*, *Hartfordshire*, and *Kent*, and by old *Windsor* Parke corner.

The Names.

It is called in Greeke ῥοῦς, and by *Hippocrates* ῥόος, in Latine also *Rhus*, for *Pliny* saith it hath no Latine name although *Gaza* calleth it *Fluida* supposing the name to be derived from ῥέω *fluo*, but it is rather a *rubore vel colore coccineo acinorum*, and therefore it was called ἐρυθρός, from whence the Latine *Russus*, and the *French Roux* came. It is called *Rhus* simply by some, as *Matthiolus &c.* *Rhus coriaria* by *Dodonæus*, and *Rhus obsoniorum* by *Lobel*, *Camerarius*, *Clusius*, and others, and *Sumach* both by shops and in *Rauwolfius*, or *Sumach Arabum*, because it was called *Rhus Syriaca* by some, it was thought to differ from the former, as also, that *Rhus culinaria* and *coriaria* or *rubra*, did differ one from another, and were severall sorts, but *Paulus Ægineta*, doth plainely shew that the seede and juyce of *Rhus coriaria* was used by Physitions: another errour *Celsus* shewed, that tooke the *Rhus Syriaca* to be *Ros Syriacus*, a kinde of *Manna*, and therefore called it *rorem Syriacum*, instead of *Rhoem Syriacum*, and *rorem sutorium* for *Rhoen Syriacum*, or *coriariorum*, not *sutorum*, as it is in *Columella*: neither should it be *Ros marinus*, but *Rhus marinus*, or *Rhus Orientalis* in *Marcellus* who appointeth it for disenteries and the like. The second hath not beene set out by any before me, onely *Bauhinus* seemeth to touch upon it, calling it *Rhus angustifolium*, saying it was brought out from *Brassile*. The third is thought by most to be the *Rhus sylvestris* of *Pliny*, that hath Myrtle like leaves, and so called by *Lobel*, *Dodonæus*, and *Lugdunensis*, and *Rhus Plinij Myrtifolia Monspelienſium* by *Gesner* and *Lobel*: yet some doe thinke it better agreeth with the *Dryophonon* of *Pliny*: the fourth is the κοκκυμηλέα of *Theophrastus*, which *Gaza* translateth *Prunus*, but should be rather κόκκο: ἐλέα, which sheweth that *Gaza* was slenderly advised to give the word such a name that a Plumme should beare a seede to be carryed away with the winde, *Pliny* calleth it *Cogygria*, or *Coggyria*, yet some have it *Coccygria*: some also thinke it to be the *Cotinus Plinij*, and for a distinction betweene it and the *Oleaster*, which is called *Cotinus* also, they call this *Cotinus coriaria Plinij*, in imitation whereof as it is thought, those that dwell at the toppes of

the *Apennine* hils doe call it *Scotano*, and those at the foote *Rossolo*, of the red colour of the barke, and not of the Dye, as some thinke, because *Plinie* saith, his *Cotinus* is, *ad lineamenta modo conchylij colore insignem*, for this as is before said, giveth a yellow colour. The *Savoyers* call the wood hereof which they loppe and fell for that purpose *Fuglet*, and we Fusticke, which all Dyers know is of especiall use with them, both the old wood to give one yellow colour, and the young another. *Matthiolus, Anguilara, Camerarius*, and *Gesner* in *hortis* call it *Cotinus*, yet *Gesner* also calleth it *Coccigria forte Barba Iouis Plinij*. *Dodonæus Cotinus Coriaria, Coccygoria* by *Clusius* and others, and of *Cæsalpinus Scotanum vulgo*, as the common people did. The last is liker to be the *Rhus sylvestris* and called by *Lugdunenses, Rhus sylvestris altera*, by *Clusius Rhus herba Plinij*, and thinketh it is the *Dryophanon Plinij* also, as *Ruellius* did before him, and *Myrtus nemoralis, Cordus* tooke it to be *Elæagnus*, and *Bellonius stirpium cultura*, tooke it to be the *Elæagnus* of *Theophrastus*, and *Lobel* therefore called it *Elæagnus Cordi*, and *Dodonæus Chamælæagnus, Lobel* calleth it *Gagel Germanorum*, and *Myrtus Brabantica*, and *Belgarum*, but I may say as well *Myrtus Anglica*, for it is as plentifull with us as with them, but that *Lobel* did not know so much? The *Arabians* call the first *Sumac, Adurion, Rosbar, Sadisticos*, or *Rosaidicos*, the *Italians Rhu*, and *Sumaco*, the *Spaniards Sumach* and *Sumagro*, the *French Sumac*, the *Germanes Gerberbaum*, the *Dutch Sumack* and *Smack*, and we in *English* Sumacke, and red Sumacke, the *French* call the last *Pinentroyall*, that is Royall Balme: the *Germanes Gagel*, as is before said, and we Gaule and sweete Willow.

The Vertues.

Sumacke both leaves and seedes, and the medicines made of them are cooling in the second degree, and drying in the third, the leaves of the first Sumacke have an astringent quality, that they may serve instead of *Acacia*, for those purposes it is used, the decoction of the leaves and seede is singular good for all sorts of fluxes in man or woman, to take them in broth, or in meate or drinke, and to sit in the decoction while it is warme, as the bloody flix, the flux of the stomacke, womens courses, and the whites also, to be drunke or invected by glisters or otherwise, or in bathes, it stayeth the stomacke that is much given to casting, the decoction of the leaves or seede made with vinegar, and a little honey put thereto is good against Gangrens or Cankers, the juyce that is taken out of the dryed leaves by boyling them in water and after they be strayned to boyle them againe with some honey, hath the same properties that *Lycium* hath, the same helpeth the roughnesse of the tongue and throate: the seede likewise boyled in water, and the decoction thereof evapoured to the thickenesse of honey, is more effectuall then the seede it selfe: the decoction of the greene leaves maketh the haire blacke to be washed therewith: the juyce of them dropped into the eares dryeth up the moisture and running of them: the seede beaten and boyled into a pultis and applyed to any inflammation or hot Impostume, cooleth them much, and doth also take away the markes and paines of bruises and blowes, as also the frettings and gallings of the skinne, the same also helpeth the hemorrhoides or piles when they bleede too much, if it be applyed with the fine pouther of Oken coales: it is singular good also to be applyed to ruptures, both inwardly and outwardly, and to stay defluxions of hot and sharpe rheumes into the eyes, and *Democrates* used it in a medicine with Poppy heads, against destillations from the head, and against want of sleepe: the gum that is found oftentimes issuing out of the tree, is good for hollow teeth, to ease the paines, and the decoction of the seede is good to wash the mouth both to fasten loose teeth, and to heale putrid and rotten gummes. What the *Virginia* Sumacke will performe, I have not knowne any hath made the proofe, but it is probable it might worke some of these effects if any would make the tryall. Both the Myrtle leafed Sumacke and the *Venice*, are in a manner as effectuall to all the purposes aforesaid, except that they are a little weaker. The Gaule is by the bitternesse and harshnesse found to be both drying and discussing, and is very effectuall to kill the wormes in the belly or stomacke: it mightily affecteth the braine, causing first perturbations and then spiting the fences: it is much used to be laid in Wardrobes, Chests, Presses, and the like, to keepe mothes from garments, and woollen cloathes as also to give them a good sent.

CHAP. XLV.

Myrtus. The Myrtle.

HAving spoken of the Gaule in the Chapter before, which some account a kinde of Myrtle both from the forme and sweetenesse, I thinke good to set the stocke of the Myrtles next thereunto, which are many, because although I have shewed you three of them in my former Booke, yet I have not shewed you all the properties they have.

1. *Myrtus latifolia maxima.* The greatest open Laurell Myrtle.

This greatest Myrtle hath great and thicke wooddy branches set with a double row of large leaves yet not so close as the next comming neere unto the smaller leaves of the Bay tree, but of a paler greene colour, abiding alwayes greene and very sweete: this sort saith *Clusius* even in *Spaine* seldome beareth either flowers or fruite, because they pruine it often, being kept in hedges for pleasure.

Clusius maketh another sort hereof which differeth little from the former, but in the leaves which are somewhat smaller and thicker, whereas the former are thinner.

2. *Myrtus latifolia exotica.* The strange broad leafed close Myrtle.

This Myrtle groweth higher then the former, and shooteth from the roote store of strong thicke stemmes more plentifully stored with large leaves, yet not so lu ly so large as the first sort, but closer set together that they almost touch one another sometimes in a double row and sometimes in a treble, and very sweete: the flowers are white like unto others but larger, after which commeth the fruite, somewhat longer then in the small sorts, greene at the first, purplish before it be ripe, and blacke when it is full ripe, with many crooked white seedes within them.

3. *Myrtus latifolia vulgaris.* The usuall broad leafed Myrtle.

This usuall broad leafed Myrtle (which I so call because we have this onely in our Country, of all other sorts of broad leafed Myrtles) groweth to be foure or five foote high with us, and in the warme Countries to be a little tree full of branches and leaves, like a small bush, the leayes are somewhat large and great, yet not so large as the last, as

sweete

1. *Myrtus latifolia maxima.*
The greateſt open Laureil Myrtle.

2. *Myrtus latifolia exotica.*
The Arange broad leafed cloſe Myrtle.

5. 7. *Myrtus Bætica ſylveſtris & minor acuto folio.*
The Spaniſh wild Myrtle and the ſmall poynted Myrtle.

6. *Myrtus domeſtica minutiſſimis foliis flore albo.*
The ſmall white Myrtle.

ſweete as the other, and the flowers white like the reſt, and ſweete likewiſe, the fruite hereof is blacke alſo.

4. *Myrtus anguſtifolia exotica.*

The ſtrange narrowleafed Myrtle.

This narrow leafed ſort groweth in all parts like unto the ſecond, but that the leafe is ſmaller, narrower, ſmall pointed, and of a darker greene colour, the flowers are alike, and ſo is the fruite blacke alſo, but greater and rounder, having crooked white ſeedes in them, as the others have.

5. *Myrtus Bætica ſylveſtris.*

The *Spaniſh* wild Myrtle.

This wilde Myrtle groweth neither ſo high, nor ſo thicke with leaves, as the former manured ſorts, but have ſlender and brittle branches, with broader leaves then the laſt, ſet more thinly on both ſides then the reſt, and of a darke greene colour: the flowers are like the reſt, and the fruite is round, ſtanding on long footeſtalkes betweene the leaves in good plenty, greene at the firſt, and whitiſh afterwards, and blackiſh being ripe full of ſweetiſh juyce, pleaſant, with ſome aſtriction to the taſte.

6. *Myrtus domeſtica minutiſſimis foliis fructu albo.*

The ſmall white Myrtle.

This white Myrtle groweth reaſonable tall, with ſlender reddiſh branches, thicke buſhing together, being thicke ſet with very ſmall (even the ſmalleſt of any other,) leaves, narroweſt of any, and ſharpe pointed, and ſomewhat darke greene alſo: the flowers are white like the reſt, and ſo is the fruite likewiſe, but of a whitiſh colour, tending to a little bluſh, and ſo abide, not changing blackiſh.

7. *Myrtus minor acuto folio.*

The ſmall and pointed Myrtle.

This ſmall Myrtle riſeth not ſo high as the third, or ordinary broad leafed ſort, but groweth fuller of branches, and thicke ſet with ſmall fine and greene, almoſt ſhining round leaves a little pointed at the ends, abiding alwayes greene, as all the ſorts of Myrtles doe, which and thē flowers arē ſweete alſo, but grow not plentifully in our Country on the branches, as in warmer places, and beareth blacke berryes, but never in theſe colder climates, howſoever houſed or defended.

9. *Myrtus flore pleno.* Double flowred Myrtle.

8. *Myrtus minor rotundiore folio.* Boxe leafed Myrtle,

This other ſort groweth in all points like the laſt, but that the leaves being as ſmall and freſh, greene, thicke growing, are rounder at the ends, very like unto the ſmall Box leaves, and beareth flowers as ſparingly.

9. *Myrtus flore pleno.* Double flowred Myrtle.

Of the greater kinde of Myrtle, there hath beene of later times one nourſed up in the Gardens of the chiefe Lovers of rarities, with as double flowers as the double Fetherfew, comming forth of a round reddiſh huske, continuing flowring at the leaſt three moneths, and each flower a fortnight, and is not over tender to be kept, yet is not ſo hardy to endure the froſts, as *Cornutus* ſaith, which Maſter *Tradeſcant* can ſufficiently witneſſe, who by a little neglect loſt a good plant overtaken with the froſt.

The Place and *Time.*

Myrtles of many ſorts are found generally upon all the Sea coaſts of *Spaine*, *Italy*, and in divers other Countries alſo. The firſt two ſorts (*Luſius* found in *Spaine*, not growing naturally wilde, but in certaine Monaſteries, and private mens Orchards. The third I thinke came out of *Italy*, becauſe it is moſt like to that ſort they ſo call. The fourth he likewiſe found in a Monaſtery, not farre from *Corduba*. The fifth in many places wilde, both of *Spaine* and *Portugall*. And the ſixt in a private noble mans garden in *Portugall*. The two laſt ſave one, are nourſed up moſt frequent in our Land, and better indure therein, with ſome good heede and looking unto: but generally even in the warme Countries they muſt be defended from the cold for feare of danger, as *Virgil* ſheweth in this Verſe *Eclog* 7. *Dum teneras defendo a frigore Myrtos*, and *Ovid* in the like manner ſaith *Metuentem frigora Myrtum*, and yet *Virgil* in another place ſaith, *Amantes frigora Myrtos*: Which how both ſhould be true, I can imagine no other, but that *Virgil* ſpeaketh of the firſt in a cold place, and of the other as they grow in a warme, that the cold place muſt have ſhelter and defence againſt the cold, as it is with us, who give them all the comfort we can: and that they that grow in a warme and hot Countrie muſt have ſhadow, for they love both ſhadow from the heate, and moiſture in the warme Countries. The laſt hath no naturall place aſſigned. They flower in *May*, and the fruite is ripe about *September*.

The Names.

It is called in Greeke μυρσίνη and μυρτίνη, ſo called a *Myrſine Athenienſi puella amica Palladis a qua curſu & palæſtra, ſuperata, inviaia dulcia interimit; arbuſcula in demortuæ vicem ſucceſſit, ſemper ut olea Minervæ chara*: but *Pæna* ſaith, *ſic vocatam volunt, propter amalam Myrrhæ odoris gratiam, in ejus baccis recentibus*: yet when we ſhew you here a *Myrtus ſylveſtris*, as well as *ſativa*, or *domeſtica*, you muſt not underſtand the *Oxymyrſine*, that is *Bruſcus*, which ſome called alſo *Myrtus ſylveſtris* to be it, but as in oppoſition to the tame or manured of the ſame kinde.

kinde. *Dioscorides* maketh mention of both these sorts, and the white one also, although he hath described but one: but some doe much mervaile that *Theophrastus* that doth so often make mention of the Myrtle, yet hath in no place described it. The first sort here set downe is the first *Myrtus* with *Clusius*, called by him *Myrtus Betica latifolia domestica*, and by *Lobel Myrtus laurea secunda*. The second is called by *Clusius*, *Myrtus Betica latifolia exotica*. The third is as I take it the *Italica Camerarij*, which *Matthiolus* and others doe describe, and may be the *Conjugula* of *Cato*, which *Pliny* calleth *nostras*, that is *Romana*, and *Lobel Laurea maxima*, and is most likely to be the *nigra* of *Dioscorides*. The fourth is the *Myrtus Betica angustifolia exotica* of *Clusius*, which *Lobel* calleth *Myrtus exotica Plinij*, and although it have not six order of leaves, as *Pliny* his *exotica*, yet saith *Clusius*, the leaves grow thicke together, that it seemeth to have more then it hath. The fifth *Clusius* calleth *Myrtus Betica sylvestris*, and is the *Myrti majoris quinta species* of *Lobel*, and *Myrtus sylvestris* of *Matthiolus*. The sixth is the *Myrtus domestica fructu albo* of *Clusius*, which *Bellonius* often remembreth in his Observations, and is the *Myrtus nona angustifolia* by *Lobel*. The two last save one are very likely to be the *Tarentina*, and so *Matthiolus*, and *Clusius* take them to be. *Lobel* calleth them *Myrtus minor vulgaris*, and so others, because as I said they best abide our Northerne Countries. The last is so called by *Cornutus* as it is in the title. The Excressence that is often found growing upon old Myrtle trees, is called *Myrtidanum* by *Dioscorides*, and *Myrtidanum*. Yet *Pliny* calleth *Myrtidanum*, the wine that is made of Myrtle berryes. There are likewise, saith *Bellonius*, in his Observations, certaine *Coccos*, or red berries, like unto the Chermes berries growing upon the Myrtles in many places of *Turky*, which have in them but one flye or worme, and used as the Chermes to dye withall. The *Arabians* call it *Aes Alas* and *As*, the *Italians Myrto*, and *Mortello*, the *Spaniards Murta*, and *Raiam*, the *French Myrte* and *Meurtre*, other Nations follow the Latine as neere as they can, the Apothecaries and Druggists shops call the berries *Myrtilli*, and we in *English* Myrtle berries.

The Vertues.

The Myrtle as *Galen* saith hath contrary quallities in it, for it hath a passing cold earthy quality in it, and a certaine thinne warme essence also, and therefore it powerfully dryeth and bindeth. The dryed leaves are more drying and binding then the fresh, which being beaten and boyled with water, is good to drinke against catarres, falling to any part of the body, and doth helpe also the fluxes of the belly or stomacke, moist ulcers, and fretting or creeping sores, being applyed to the swellings and heate of the eods, the Impostumes of the fundament, and Saint *Anthonies* fire: the decoction of the leaves is good for the resolution of the Arteries and joynts, and their weakenesse to sit in or over the same, as in a bath, and doth helpe to consolidate broken bones or out of joynt, that will hardly be cured, it helpeth the soreneſse of the nayles, and that rising of the skin about them, if the pouther of the dryed leaves be cast thereon: the juyce of the leaves is of the same effects, whether out of the fresh leaves, or taken from the dry, by infusing red Wine on them, and is safely used where there is neede of any binding medicine, or to heale the ulcers of the mouth or privy parts: the same also helpeth watering eyes or those that beginne to have a filme or skin to grow that will take away the sight. The seede is good for the tremblings and passions of the heart, and to helpe those that spit blood, or have the bloody flixe, it stayeth also womens immoderate courses, and the whites also, it helpeth the sting of Scorpions, and the bitings of venemous creatures, and of the Spider *Phalangium*, and the danger of Mushromes: being drunke in Wine, it helpeth a stinking breath, and amendeth that which is not sweete, the same also heated with Wine healeth old ulcers, that are hard to cure: it helpeth the diseases of the bladder, and provoketh urine, it also bindeth the belly, and stayeth the fluxe of humours, the blanes, wheales, and other breakings out in the skinne: the decoction of them, is good for women to sit in or over, that are troubled with the falling downe of the mother, and is good also for the falling downe of the fundament, and the piles. The Excressence called *Myrtidanum*, is of greater force to dry and binde then either leafe, juyce, or seede: the juyce condensate of Myrtles is commended by *Matthiolus* for a better substitute, for *Acacia*, then the juyce of Sloes, which hath not that aromaticall sent, and strengthning quality that the Myrtle hath.

CHAP. XLVI.

Vitis Idea sive Myrtillus Germanica vel Vaccinium frutex. Whortle berries.

THere are divers sorts of these low shrubs, which must all goe under the name of Whorts or Whortle berries, although there is much difference betweene them.

1. *Vaccinia nigra vulgaria.* Blacke Whortes or Bill berries.

This small bush creepeth along upon the ground, scarce rising halfe a yard high; with divers small darke greene leaves set on the greene branches, which it spreadeth abroad on both sides, but not alwaies one against another, somewhat like unto the smaller Myrtle leaves, but not so hard, and a little dented about the edges: at the foote of the leaves come forth small hollow pale blush coloured flowers, the brimmes ending in five points, with a reddish thred in the middle, which passe into small round berries of the bigneſse and colour of Iuniper berryes, but full of a purple sweetish sharpe or sowre juyce, which doth give a sad purplish colour to their hands and lips that eate and handle them, especially if they breake them; containing within them diver small seed: the roote groweth aslope under ground, shooting forth in sundry places as it creepeth: this looseth the leaves in Winter.

2. *Vaccinia nigra fructu majore.* The greater Bill berry.

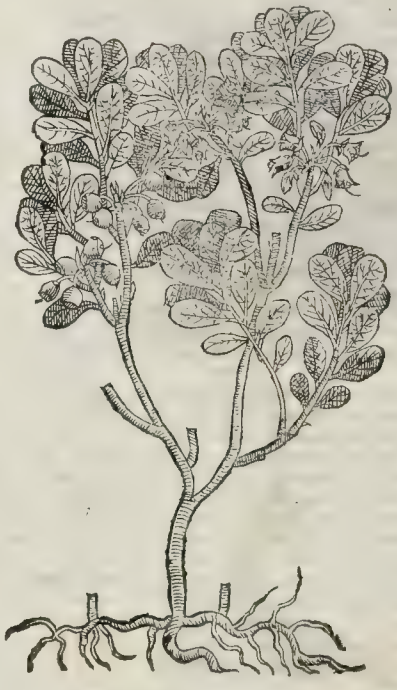
This other Bill berry groweth greater and higher then the former, whose lower part of the branches are of an ash colour, but the upper part, greene and sometimes reddish, the leaves are somewhat rounder pointed the flowers and berryes, are like the other in all things, save that they are larger, but of the same colour being ripe, and of a more pleasant sweete and lesse sharpe taste: the roote creepeth in the same manner.

3. *Vaccinia nigra Pannonica.* *Hungarian* Blacke Whorts.

This *Hungarian* Whort hath tough slender stalkes, lying for the most part, on the ground, and there taking roote

1. *Vaccinia nigra vulgaria.*
Blacke Whorts or Bill berries.

2. *Vaccinia nigra fructu majore.*
The great Bill berry.



3. *Vaccinia nigra Pannonica.*
Hungarian Blacke Whortes.

4. *Vaccinia rubra Buxi folijs.*
Red Whortes with Boxe leaves.

6. *Vva Vrſi Galeni Cluſij.*
The Spaniſh red Whort.

7. *Vitis Idæa tertia Cluſij.*
The French Hony ſweete Whorts.

8. *Vitis Idæa Cretica elatior*
The taller red Whorts of Candy;

9. *Vitis Idæa Cretica humilior.*
The lower Candy red Whorts,

roote againe in ſome places, with many branches, ſcarſe raiſing up themſelves above the Moſſe, among which it groweth, having ſundry long and ſomewhat narrow leaves, upon long footeſtalkes ſet without order on them, greene above and paler underneath, and a little nicked about the edges, with a few ſoft haires on them alſo, and of a very aſtringent taſte: the flowers come forth at the end of the laſt yeares ſhootes or branches, which were not obſerved, but there ſtood blacke round berries, as bigge almoſt as Cherries, upon long footeſtalkes, hanging downe when they were ripe, but reddiſh before, full of a not unpleaſant juyce, conteining within them no ſtones like

like Cherries but five seedes for the most part, being flat and white: the roote is woodby with some fibres joyned thereto: this holdeth the greene leaves all the Winter.

4. *Vaccinia rubra buxeis foliis.* Red whorts with Boxe leaves.

This red Whort riseth up like unto the great blacke Whort, having sundry harder leaves like unto the Boxetree leaves, greene and round pointed standing on the severall branches at the toppes whereof onely, and not from the sides, as in the former come forth divers round and somewhat long hollow flowers, of a pale red colour, after which succeede round reddish sappy berryes, when they are ripe, of an acide and astringent taste: the roote runneth in the ground like the blacke: the leaves hereof fall not away in Winter.

5. *Vaccinia rubra longioribus foliis.* Red Whorts with longer leaves.

This other red Whorte is like a low creeping shrub, but groweth somewhat thicker and greater then the former red, the leaves whereof are longer narrower and sharper pointed then it, and growing reddish toward Autume, but yet abiding on the branches like the former, and not falling of in Winter: the flowers are like the other, and so is the fruite, but not sappy, or with juyce therein, but dry and sapleſſe, and without any manifest taste.

6. *Vvaursi Galeni Clusio.* The *Spanish* red Whort.

This *Spanish* Whort likewise differeth not much from the former red sorts, having slender flexible stalkes and branches, about a foote long, lying on the ground, covered with a reddish barke, somewhat like unto the tender branches of the Strawberry tree, having sundry leaves set thereon, neere resembling the Strawberry tree leaves but lesser, being thicke and sappy, but not hairy at all, and somewhat bitter with the astringent taste: at the ends of the branches grow divers bottle like or hollow round flowers, growing in clusters of the same whitish blush colour that they are of, after which follow round red berries, like unto small Cherryes, but of an acide taste: the leaves hereof likewise abide on the stalkes and fall not away in Winter.

7. *Vitis Idæa tertia Clusij.* The *French* honey sweete Whortes.

This riseth higher then any of the former, to be foure or five cubits high, with sundry thicke smooth wooddy stemmes from the roote, the lower parts being somewhat rough and covered with a blackish barke, the upper branches being greene, stored with many leaves thereon, set without order, which are somewhat long with the roundnesse, and a little dented about the edges, of a sad greene colour above and very hoary underneath: at the joynts with the leaves come forth many white flowers, consisting of five leaves a peece, after which come small round berries somewhat bigger then Hawthorne berries, and blacke when they are ripe, having a small crowne as it were of five small points which were the flowers, sticking at their toppes, and being sappy of a sweetish taste like honey, with sundry blackish seede within them.

8. *Vitis Idæa Cretica elatior.* The taller red Whortes of *Candy*.

This small shrubby plant sending forth sundry slender wooddy blacke shootes from the roote, the wood being hard and white without any sent, but somewhat heating the tongue on the tasting, parted into divers branches, furnished at the joynts, by unequall spaces, sometimes with single leaves, but usually with two, and sometimes with three or foure together, which are somewhat hard and almost round, dented also a little about the edges, being somewhat like unto Holly, but nothing so hard or prickely, of a sad greene colour on the upper side and grayish the lower, at the ends of the branches, and at the joynts also with the leaves come forth sundry white Cherrylike flowers, each on a long footestalke, and after them small round and somewhat long reddish fruite, of a pleasant taste, of the bignesse of a Beane, having a freezy or woolly crowne at the toppes, and being dry turneth blacke and hard.

9. *Vitis Idæa Cretica humilior.* The lower *Candy* red Whorts.

This other *Candiot* groweth much lower, fuller of sprigges slenderer also and shorter whereon at unordinary spaces, stand unordinary leaves, three or foure sometimes together, being almost round like unto the last, but lesser softer, smoother and not so much dented about the edges, neyther yet of so sad a greene colour on the upperside, nor so gray on the under, at the joynts likewise with the leaves come forth long stalkes, with many the like white blossomes in a cluster, turning into smaller berries, of a darke red colour, and a little downy at the head, somewhat like unto Mirtle berries, which are familiarly eaten by the Shepheards, and others of the Country.

The Place and *Time.*

The first groweth in many heathes, woods and barren hilly places of this Land, as *Hampsteede Heath*, *Finchley*, and Saint *Johns* wood, not farre from *London*, and in sundry other places. The first red sort in the North parts, as *Lancashire*, and *Yorkeshire*, on the hills, &c. The rest grow in *Hungaria*, *Bavaria*, and *Germany*, and in other Countries also. The sixth *Clusius* found in *Spaine*, and the branches and berries were shewed me by *Boel*, that brought them out of *Spaine*. The seventh groweth as *Lobel* saith on every of the hils in *Provence* of *France*, and *Clusius* on the hils nigh *Vienna*. The two last in *Candy*. They all flower in *March* and *Aprill*, and the fruite of the blacke is ripe in *Inne* and *July*, the other later.

The Names.

The first blacke sorts are taken generally by the best later Writers, to be the ἄμπελος ἀγρία of *Theophrastus*, that is, *Vitis ex parte Idæa, quam vocant Phalacras*, but *Pliny* falsly put in *Alexandrina* instead of *Idæa*, in Latine by them *Vitis Idæa Theophrasti*, and because all the rest have a resemblance thereunto, they are all called *Vites Idæa*, likewise, with their severall distinctions, as you shall presently heare: they are many of them also called *Vaccinia*, by divers, thinking the black sort to be the *Vaccinia nigra* of *Virgil*, & by the transposition of a letter *Baccinia nigra parva quasi bacca*; but that errour is exploded by many good Authours, that shew *Virgil* putteth his *Vaccinia* among flowers and not fruites; for as he saith, *Et sunt Viole nigræ, & Vaccinia nigra*, intending the colours were both alike, as a kinde of *Hyacinth*, which he might meane is as the Violet flower. *Vitruvius* and *Pliny* indeede have a *Vaccinium* which giveth a purple dye to servants or others garments, which may very wel be this, for such a purple colour will the juyce hereof give, if it be rightly ordered. It is also called *Myrtillus*, and by some *Myrtillus Germanica*, because the Physitions and Apothecaries in *Germany* and those parts, tooke them to be true Mirtle berries, and so used them untill they were shewed their errour, and since have forsaken it, as we have done also. *Gesner* also in *hortis* sheweth, that some did take the *Vitis Idæa*, to be that Vine that beareth Currans, but saith he, that noble Vine groweth not on so high or snowy mountaines, but rather in the Planes and open hils, and ordered by the industry of men. The first *Tragus* calleth *Myrtillus exiguus*, and so doe *Matthiolus* and *Lugdunensis*. *Dodonæus*

donæus and *Lobel*, called it *Vaccinia nigra*, *Anguilara*, *radix Idæa fructu nigro*, *Camerarius*, *Gesner* and *Clusius*, *Vitis Idæa vulgaris baccis nigris*, *Cæsalpinus Bagolæ primum genus*. The second is called by *Tragus*, *Myrtillus grandes*, and is the *Vitis Idæa major* of *Thalius*, the *Vitis Idæa secunda sive altera* of *Clusius*, and the *Vitis foliys subrotundis exalbidis*, although he hath transposed some of these titles to his second, which is my third whereof onely *Clusius* maketh mention and calleth it his first, and *Gerard*, *Vaccinia Pannonica*, and *Bauhinus* calleth *Vitis Idæa foliys oblongis albicantibus*. The fourth is called *Vaccinia rubra*, and *Vitis Idæa rubra*, by all writers thereof: *Camerarius* and *Thalius* say that some tooke it to be *Rhus minor Plinij*; and *Clusius Vitis Idæa buxeis foliis*, and *Anguilara Radix Idæa fructu rubro*, as he did the blacke before, *Radix Idæa fructu nigro*, and *Lugdunenses* doth thinke that this is most properly the *Radix Idæa* of *Dioscorides*. The fifth is mentioned onely by *Camerarius* in *horto*, who calleth it *Vitis Idæa rubra Bavarica*. The sixth is referred by *Clusius* to the ἀγκοσταφυλος of *Galen* in his seventh Booke, *de compositi. med. secundum locos. cap.* 4. and thereupon he called it *Uva ursi Galeni*, *Bauhinus* refereth it to the *Vitis Idæa*, making it his sixth and calleth it *Idæa radix Dioscoridis* also. The seventh is called by *Clusius Vitis Idæa tertia*, not thinking his former to be so worthy of that name, *Lobel* saith the *French* call it *Amelanchier*, and doubteth if it be not that shrub which they call *Alisier*, *Bellonius* saith, that their *Melanchier* is called in *Candy Agriomelea* and *Codomalo*, but I thinke he is deceived, that having blacke, and this red fruite: *Gesner* in his Epistles, as *Clusius* saith (if he meant this plant) giveth it divers names, as *Myrtomalis*, *Petromelis*, *Pyrus Cervina*, and *Pyraster Idæa*. *Dalechampius* taking it to be *Cotonaster Gesneri*, calleth it *Epimelis altera*, but giveth it red berries, which therefore I suppose may be rather one of the two last. The two last are mentioned by *Alpinus*, in his Booke of Exoticke plants, by the name of *Cerasus*, and *Chamæcerasus Idæa Cretica*, thinking the former most neerely to be the *Cerasus Idæa Theophrasti*. The *Italians* did use to call the first *Mirtillo*, but now *Vite Idæa*, according to the Latine, the *French Airelle* and *Aurelle*, the *Germanes Heidelbeer*, the *Dutch Crake besien*, and we Whorts or Whortle berryes, and Bill berries with us about *London*.

The Vertues.

The Bill berries doe coole in the second degree, and doe a little binde and dry withall: they are therefore good in hot agues, and to coole the heat of the stomacke and liver, and doe somewhat bindle the belly, and stay castings, and loathings, but if that they be eaten by those that have a weake or a cold stomacke, they will much offend and trouble it saith *Camerarius*, and therefore the juyce of the berries being made into a Syrupe, or the pulpe of them made into a conserve with Sugar, will be more familiar to such, and helpe those paines, the cold fruite procured, and is good for all the purposes aforesaid, as also for those that are troubled with an old cough, or with an ulcer in the Lungs or other disease thereof: with the juyce of the berries Painters to colour paper or cards, doe make a kinde of purple blew colour, putting thereto some Allome and Galles, whereby they can make it lighter or sadder as they please. And some poore folkes as *Tragus* sheweth, doe take a potfull of the juyce strained, whereunto an ounce of Allome, foure spoonefuls of good Wine vinegar, and a quarter of an ounce of the waste of the copper forgings, being put together, and boyled all together, into this liquor while it is reasonable, but not too hot, they put their cloth, wooll, thred or yarne therein, letting it lye for a good while, which being taken out and hung up to dry, and afterwards washed with cold water will have the like *Turkie* blew colour, and if they would have it sadder, they will put thereto in the boyling an ounce of broken Gaules: *Gerard* saith, that hee hath made of the juyce of the red berries, an excellent crimson colour, by putting a little Allome thereto: the red Whorts are taken to be more binding the belly, womens courses, spitting of blood, and any other fluxe of blood or humours, to be used as well outwardly, as inwardly.

CHAP. XLVII.

Iovis barba frutex. The silver Bush.

Iovis barba frutex, The Silver Bush.

THis beautifull fine bush groweth to the height of a man, with a number of slender branches, thicke bushing out on all sides, whereon grow long winged leaves made of many small ones like Lentill leaves, but narrower, each set against other, with an odde one at the end, of a faire greene colour on the upperside, and of a silver white shining colour underneath, the young leaves being also of the same colour: at the ends of the branch standeth large umbels of yellow flowers, made after the fashion of broome flowers, set in grayish huskes, like the heads of the three leafed grasse, after which come small narrow short pods, soft and grayish likewise, with two or three small round, and somewhat long blackish gray seede in them: the roote is hard and wooddy: this is very tender, not induring our Winters, although housed, nor any where in our Country, but in a warme stove, where the fire may preserve it from the cold, which it will not abide early or late: that is, it must be housed betimes, and not set abroad too earely.

The Place and *Time.*

It groweth on the hill *Setius*, called *Cap de sette* of the *French*, not farre from *Agatha*, by *Mompelier*, as also upon *Mons niger*, not farre from *Ligorne* in *Tuscany*. And flowreth in *May* in the naturall places, the seede being ripe in *July*.

The Names.

I finde none of our moderne writers, to have made mention hereof, before *Anguilara* (who found it on the blacke hill

by,

by *Ligourne*, as is before ſaid, and in his firſt kinde of *Barba Iovis*) ſince *Pliny*, who ſpeaketh thereof *lib. 16. c.* 1 that it ſhunned the waters, and was called *Iovis Barba*, and was fit to make hedges and border up beds, to be fra med into any worke in a Garden, and *Caſalpinus* ſince him. *Camerarius* onely nameth it, and ſo doth *Cluſius*, bu *Lugdunenſis* deſcribeth it, and laſtly *Bauhinus* in his *Pinax*, and all of them by the name of *Barba Iovis*, and yet th *Sedum majus*, great Houſeleeke is alſo called by that name, but to put a diſtinction betweene them, this is calle *Barba Iovis arbor* or *frutex*.

The Vertues.

There is nothing extant of any Phyſicall property, whereunto this plant may be applyed, and therefore thu much ſhall be ſufficient untill the Vertues be better knowne.

CHAP. XLVIII.

Periclymenum ſive Caprifolium. Woodbind or Hony Suckles.

WE have divers ſorts of plants under the name of *Periclymenum*, ſome that are winding about whatſoeve ſtandeth next them, and for the moſt part knowne throughout the Land, others are ſtrangers, or not ſo well knowne: there are likewiſe divers that winde not, but ſtand upright, which I would ſeparate in ſunder as *Bauhinus* doth, but not make them kindes of baſtard Cherries as hee doth, but joyne them in name, although I disjoyne them by Chapter, both becauſe they have notable differences, and that I might no trouble you or my ſelfe with too many ſorts in one Chapter.

1. *Periclymenum ſive Caprifolium vulgare.* Our ordinary Woodbinde.

Our common Woodbind is well knowne to grow up with a woodly ſtalke and branches, winding themſelvēs yet without claſpers, ſo ſtrictly unto whatſoever branch of any other tree, that it leaveth an impreſſion therein of the winding, ſet with ſundry leaves by couples, which are ſomewhat broad and long, round pointed, and of a whiſh greene colour above, and more whitiſh underneath: at the toppes of the branches come forth many long and hollow whitiſh and yellow flowers ſtanding on both ſides, with many ſmall threds ſticking in the middle of them of a fine ſweete ſmell: after which ſucceede in the bunches of red berries, wherein is contained ſmall hard ſeede the roote is wooddy with many fibres.

2. *Periclymenum ſive Caprifolium Germanicum flore tubello.* The *Germane* rēd Honiſuckle.

This *Germane* ſort groweth higher and larger, ſpread then the former, but ramping in the like manner, with the like leaves, but ſomewhat larger: the flowers are alſo, being red in the bud before they be blowne open, and continuing reddiſh on the outſide the bottomes of the flowers being wholly white on the inſide.

3. *Periclymenum perfoliatum ſive Italicum.* Double Woodbinde or Honiſuckles.

The double Hony ſuckle groweth in the ſame manner as the other, but ſpreadeth more and farther, with whi tiſh ramping branches, and ſuch manner of whitiſh greene leaves ſet on both ſides of the branches up to the tops,

1. *Periclymenum ſive Caprifolium vulgare.*
Woodbinde or Honiſuckles.

3. *Periclymenum perfoliatum ſive Italicum.*
The double Hony ſuckle.

where

where it beareth many flowers, at two or three severall distances one above another, with two round leaves under them, at the joynts joyned so close together, that they seeme like sawsers to hold the flowers, which stand in the middle, and are of the same fashion and colour with the former, that is of a whitish yellow colour, with open mouthes, dasht over with a light shew of purple, with threds within them likewise, and as sweete: this beareth seede likewise, but not so many together.

4. *Chamæpericlymenum.*
Dwarfe Hony suckle.

This Dwarfe Hony suckle hath a creeping roote, running here and there underground, and shooting up stalkes with sundry leaves set by couples at the joynts, full of veines, and with five ribs running all the lenth of the leafe to the end, which is pointed, smooth and not dented about the edges, from the toppes of the stalkes grow forth two branches, with foure or five such like leaves as grow below, and from betweene the foote of them commeth a small tuft of flowers, (which were not observed) and after them many red berries set in a bunch or knob together, like the Mulberry, but longer, and therefore I thinke it should rather pertaine to the family of the *Chamæmori*, but that, as *Clusius* to shew, not only his love to Doctor *Penny*, in letting it passe by his name, but also his judgement thereof by the name, so I, until I can have better knowledge of the Plant, must let it so passe, but with my caution.

4. *Chamæpericlymenum.*
The Dwarfe Honysuckle.

The Place and *Time.*

The first groweth every where in this Land, in the hedges abundantly. The second in *Germany*. The third in *Italy*, *Spaine*, *Provence* of *France*, *&c.* Both it and the second are onely kept in our Gardens, or Orchards, or set against an house side to runne about the Windowes, where they keepe the roomes coole, and make a goodly shew without. The last was found by Doctor *Penny*, as *Clusius* saith, by *Dantzicke*, who gave him both the figure and the description as it is here expressed. The first is in flower in *Iune*, and the fruite is ripe in *August*. The second and third are earlier, both for the flower and fruite, yet we never saw fruite of the second to follow any of the flowers.

The Names.

It is called in Greeke περικλυμενον, but the Greekes in these dayes, περικλωνας, in Latine *Periclymenum* also, and *Caprifolium*, but *Pliny* mistaking the word *Periclymenum*, setteth downe the properties of *Clymenum* for it, with some *Matrissylva*, *Volucrum majus*, and *Liliumінter spinas*, and *Vinciboscum* by *Cæsalpinus*, according as his *Italians* called it. The first and third are called by all Authours that have written of them, either *Periclymenum* or *Caprifolium*, some entitle the first *Germanicum*, and some *vnigare Septentrionalium*, but the second is more rightly termed *Germanicum*, because I thinke no Country hath it naturally but that. The third is *Perfoliatum alterum*, or *grandius & Italicum*. But the last was first set out by *Clusius*, and from him *Tabermontanus*, *Gerard*, *Bauhinus*, and my selfe have it. The *Italians* call it *Vinciboscо*, the *Spaniards Madreselua*, the *French Chevrefeuille*, the *Germanes Geyssbladt*, and *Speckgilgen*, the *Dutch Gheytenbladt*, and *Memmekens*, and we in *English* Wood binde, and Honysuckle.

The Vertues.

We in our Land have by tradition continued so long in this errour to use the leaves, and flowers, in all gargles, and lotions for inflammations in the mouth, or the sore privy parts of man or woman, that I thinke the custome is growne too strong by time for me with a few words to shew the inconvenience, that it may be reformed, for they are neither cooling nor binding, as they are taken to be: but are of a clensing, resolving, consuming, and digesting quality, as Hyssope, Oiganum, and Winter Savoury are, that with Figges and Licoris, are effectuall to expectorate flegme from the chest and lungs, wherewith they are filled: and that it is not fit to be used in inflammations the very taste of the herbe holding a leafe in ones mouth will declare, by the burning heate will be felt therein, and as *Dioscorides* and *Galen* say, that the decoction thereof being drunke sixe dayes together, will render the urine as blood: although at the first they will but provoke urine onely, the fruite and leaves as well as the flowers, are of one effect: but the flowers and leaves are of more use then the seede, which is said to consume the spleene, and to procure a womans speedy delivery, but whereas it is said to bring barrennesse to men that use it, it cannot properly be said of men, but of women to be barren, and of men to be unable to generation, or their seede unprofitable upon sundry causes: the leaves or flowers in pouther or the distilled water of them, is much commended to clense and dry up foule and moist ulcers, and to clense the face and skinne from morphew, sunburne, freckles, and other discolourings of the skinne. The oyle wherein the flowers have beene infused and sunned, is good against cramps, convulsions of the sinues, and palsies, and any other benumming cold griefe. The double Honysuckle may safely be used to all these purposes, when the other is not at hand.

Chap. XLIX.

Periclymenum rectum. Vpright Woodbinde or Hony ſuckle.

OF this kinde of *Periclymenum*, there are three or foure ſorts, as you ſhall preſently heare.

1. *Periclymenum rectum fructu rubro.* Red berryed upright Hony ſuckle.

The divers ſtalkes of this Hony ſuckle, are ſomewhat ſtraight and upright, about three or foure foote high, at the leaſt, divided and ſpread into divers branches, covered with a very thinne whitiſh barke: the leaves ſtand by couples on the branches and two likewiſe at every joynt, which are of a whitiſh greene colour, ſmooth, and leſſer then thoſe of the former winding Woodbindes: the flowers alſo ſtand by couples at the end of ſhort ſtalkes, that come forth from the joynts with the leaves, and are much ſmaller then the other, and never opening or ſpreading much, of a pale whitiſh colour, after which come two red berries, long with the roundneſſe, both of a bigneſſe in the naturall places, and in ſome open places, and ſeldome ſo with us, for one is uſually withered and never commeth to perfection.

2. *Periclymenum rectum fructu nigro.* Blacke berried upright Hony ſuckle.

This groweth not ſo high as the firſt, nor ſpreadeth ſo much but groweth greater in the ſtemme and more upright, whoſe barke is not ſo white: the leaves grow in the ſame manner, but are ſomewhat longer and dented about the edges, the flowers ſtand upon ſmall ſtalkes, as in the former, two uſually together, yet ſometimes but one, of a more purpliſh colour, and ſomewhat leſſer, unto whom ſucceed blacke berries, full of juyce, of no unpleaſant taſte: the roote in both are hard and wooddy.

3. *Periclymeno rectum fructu cæruleo.* Blew berryed upright Hony ſuckles.

This is alſo a low ſhrubbe riſing not much higher then the laſt, the ſtemme being greater and covered with a rugged blackiſh barke with divers ſmall branches thereon, the youngeſt being reddiſh at the firſt, and hoary withall: the leaves ſtand by couples as in the reſt, ſomewhat like unto the firſt, of a drying and bitter taſte, the flowers grow by couples, ſmall and pale of colour, as the firſt, after which commeth but one berry uſually, ſomewhat long and round, of a blewiſh colour with a ſweete and little tart juyce within them, colouring the hands red that handle them, and have within them many flat ſeede.

4. *Periclymenum rectum fructu rubro ſingulari majore.* The greater upright Hony ſuckle.

The leaves hereof are greater then any of the former, and pointed at the ends, ſet in the ſame manner by couples, on the low ſtalkes, that are not above a cubit high, and they are harder in handling, greene above and gray underneath: the flowers ſtand by couples as in the reſt, and are of a purpliſh white colour, or ſomewhat deeper ſometimes but unto them ſucceede but one berry, the biggeſt of them all even as large as a cherry, red, ſappy, and tranſparent, having two markes at the top, where the flowers grew, but containing within it but one ſeede.

1. *Periclymenum rectum fructu rubro.*
Red berryed upright Hony ſuckle.

2. *Periclymenum rectum fructu nigro.*
Blacke berryed upright Hony ſuckle.

3. *Periclymenum rectum fructu ceruleo.*
Blew berryed Honyſuckle.

4. *Periclymenum rectum fructu rubro ſingulari majore.*
The greater red upright Honyſuckle.

The Place and *Time.*

All theſe ſorts were found by *Cluſius* in *Germany*, *Auſtria*, and *Syria*, and ſome on the *Pyrenean* hils, and in *Savoy*, the moſt of them are kept in our Gardens, they flower in *May*, and the fruite is ripe in *Auguſt*.

The Names.

Some have called theſe ſhrubs by the name of *Xyloſteum quaſi Lignum oſſeum ob duritiem*, for they have not beene knowne to the ancient Writers, as it is ſuppoſed, but found out by the moderne, and for the reſemblance of the flowers, in likeneſſe although not in bigneſſe, unto Honyſuckles, and that the ſhrub groweth upright, not leaning or winding as the former kindes doe, they have given them the name of *Periclymenum ſtans* or *rectum*, as the fitteſt Epithite to demonſtrate them, and each with diſtinctions one from another, as is fitteſt. The firſt is the *Periclymenum Allobrogum* of *Lobel*, and *Periclymenum rectum fructu rubro*, and the firſt with *Cluſius*, and *Xyloſteum*, with *Dodonæus*, *Camerarius*, and *Thalius*: *Geſner in hortis* calleth it *Periclymeno cognatus frutex*, and *Tragus*, and *Lonicerus* in the infancy of Herbariſme, not knowing whereunto well to referre them, called it *Halimus*. The ſecond is the ſecond *Periclymenum rectum* of *Cluſius*, and ſo is the third here, his third in his Hiſtory of Plants. The laſt is *Cluſius* his fourth *Periclymenum rectum*, which *Geſner* at the end of *Cordus*, his hiſtory of Plants, calleth *Chameceraſus montana*, and *Lobel Chameceraſus Alpigena*, *Dodonæus* and *Eyſtetenſis Xyloſteum alterum*, *Lugdunenſis* taketh it to be the *Ficus Idæa Theophraſti*, *lib.* 3. *c.* 17. and calleth it *Ficus Idæa noſtras vulgo Frangula*, but *Cluſius* ſaith, he cannot conſent to that opinion, nor that it ſhould be *Pliny* his *Ficus Idæa* neither, *Cluſius* ſaith, that they of *Auſtria* and *Styria* call the firſt *Hunds kirſchen*, and *Bein holtz*, and the three firſt ſorts *Hunds beer*, and we according to the Latine name, upright Honyſuckle. *Bauhinus* calleth all theſe ſorts by the name of *Chamæceraſus*, whereof many doe much marvell, ſeeing the faſhion of flowers declare plainely unto what ſtocke of right they are to be referrad.

The Vertues.

There is no one that hath ſhewed theſe, that hath heard of any property of any of theſe berries or the ſhrubs, have in Phyſicke, but thoſe that are pleaſant are eaten oftentimes, and the third ſort is much ſought after, by the people where it groweth, to ſerve the Dyers uſe.

Chap. L.

Gelſeminum ſive Iaſminum. The Iaſminē or Gelſēminē.

Serapio hath exhibited unto us in his workes, three ſorts of Iaſmines, with white, blew, and yellow flowers, whom *Tabermontanus* and others doe follow, although without all knowledge of them: divers others much doubting the truth of the blew and yellow, have thought none ſuch to be in *rerum natura*, but time and induſtry, the diſcloſers of hidden ſecrets, have brought them to light, yet very lately, and ſcarſe knowne to our world, or therein but to a few; the true yellow I will ſhew you in this Chapter, with divers other rare ones, ſome true, and ſome that are received for Iaſmines, with divers others, and in the next, that yellow Iaſmine, which formerly was taken for the right, but farre differing therefrom, ſaving onely in the forme of the flowers, and in the next Chapter unto that, the true ſort of *Serapio*, his blew Iaſmine, as I verily ſuppoſe, yet becauſe the growing thereof is not anſwerable to the Iaſmines, but more correſpondent to the *Lilac*, beſides the *Perſian* name whereby it came, although many of the leaves thereof reſemble a Iaſmine, I have placed it there, not without reaſon as I take it.

1. *Gelſeminum vel Iaſminum album vulgare.* The ordinary white Iaſmine.

The ordinary white Iaſmine hath ſundry very long ſhootes from the rootes, ſometimes twelve, yea twenty foote high: divided in many branches, covered with a darke grayiſh barke, the younger branches being greene with a white pith within like the Elder, whereon are ſet at ſeverall places, long winged darke greene leaves, made of many ſmall and pointed leaves, and the largeſt at the end, and longeſt pointed: at the toppes of the young branches, ſtand divers flowers in a tuft together, each on a long greene ſtalke, which ſuſtaineth a ſmall long hollow truncke, ending in five white leaves, pointed and ſmelling very ſtrong and ſweete, which fall away without bearing any fruite in our Country, but in the hotter where it is naturall, it beareth a flat ſeede like a *Lupine*: the roote ſpreadeth much and farre in the ground, and giveth many ſuckers.

2. *Gelſeminum vel Iaſminum Catalonicum ſimplex.* The ſingle Spaniſh Iaſmine.

This Spaniſh Iaſmine groweth lower then the former by much, but hath leaves and flowers growing in the ſame manner, and differeth from it onely in the leaves, being ſomewhat broader, ſhorter, and thicker, and in the flowers which are larger, and purpliſh on the outſide, before they be open, and white with purpliſh edges, when they are blowen open, exceeding ſweete of ſmell more then the former.

3. *Gelſeminum vel Iaſminum Catalonium multiplex.* The double Spaniſh Iaſmine.

This kinde of Spaniſh Iaſmine groweth very like but leſſer then the ſingle kind ſhooting forth ſuch like leaves, but of a freſher greene colour: the flowers likewiſe ſtand at the toppes of the branches, many together, but the hollow trunckes are ſhorter by the halfe ending in five or ſix leaves laid open like a ſtarre, within which riſe three

1. *Gelſeminum vel Iaſminum album vulgare,* The ordinary white Iaſmine.

2. *Gelſeminum vel Iaſminum Catalonicum ſimplex,* The ſingle Spaniſh Iaſmine.

or

or five dayes, yet withering upon the ſtalkes fall not away, but after many dayes ſo abiding, another flower will breake forth of the ſame trunke ſometimes: this hath a quicker ſent then the other.

4. *Gelſeminum ſive Iaſminum Indicum flavum odoratiſſimum.* The Indian moſt ſweete yellow Iaſmine.

This rare Iaſmine riſeth in the warme Countries to be two or three cubits high, the barke whereof is ſmooth, and as red or purple as the Flower-gentle, ſpreading forth branches on all ſides even from the loweſt almoſt, and they againe divided into other leſſer ones, bearing at ſundry places, without order in ſome places, three leaves, in ſome five on a ſtalke, of a very ſad or deepe ſhining greene colour, not dented at all about the edges, nor falling away in Winter, each part whereof is ſomewhat like the leafe of the Pomgarnet tree, but harder and thicker, the flowers grow in the ſame manner at the toppes of the branches, and in tufts, formed very like unto thoſe of the Spaniſh Iaſmine, but ſomewhat leſſer, yet abiding longer, and of a faire gold yellow colour, and exceeding ſweete, after which ſucceed ſmall round heads leſſer then Ollives, greene at the firſt, and blackiſh blew being ripe, cleere, ſhining alſo like a grape, ſtanding ſingly, and ſometimes double upon a ſtalke including certaine blackiſh long ſeed like Peare kernels. This plant is more eaſie to be propagated, either by ſuckers or layers, but is very tender to keepe, not abiding either the leaſt of Winters breath nor yet the cold Autumne dewes, but much delighteth in warmth and moiſture, yet neither enduring much raine or watering, to fall on his leaves or flowers, which will change the flowers paler, and the green leaves yellower, and therefore muſt have the moiſture diſtilled at the rootes. This holdeth the greene leaves in the Winter.

495. *Gelſeminum ſive Iaſminum Indicum flavum odoratiſſimum, & tertium Virginianum odoratum ſcandens ſemper virens.* The moſt ſweete yellow Indian Iaſmine. And the ſweete yellow climing yellow Iaſmine of Virginia.

5. *Gelſeminum ſive Iaſminum luteum odoratum Virginianum ſcandens & ſemper virens.* The ſweete yellow climing *Virginian* Iaſmine.

This *Virginian* Iaſmine hath a pretty bigge wooddy ſtocke next to the ground, from whence riſe ſundry hard ſtalkes, dividing it ſelfe into many branches, ſpreading very farre upon the trees, or any thing ſtandeth next to it, whereon are ſet at ſeverall ſmall diſtances, two pretty large Mirtle-like ſmooth leaves, but placed on contrary ſides, each above other, as they are diſpoſed in the double *Syringa Arabica*, or Pipe-tree: the flowers ſtand three or foure together, at the ends of the branches, ſomewhat like unto the former Iaſmines, with a long hollow trunke, ending in five points, but not laid open into leaves like them, of a yellow colour, ſmelling very ſweete, after which follow ſmall, ſomewhat flat and long ſmooth yellow pods, parted in the middle all the length, full of ſmall flat browniſh ſeedes, winged as it were or skinny at the one end, and piled cloſe one upon another in each ſide of the pod.

The Place and Time.

The three firſt ſorts have beene brought, as it is thought out of *Syria* into *Spaine*, where they thrive paſſing well. The firſt ſort, which they account to be wilde, ſerveth to graft the other two upon, that they may grow and thrive the better; we keepe the ſecond with much care and proviſion, being more tender then the firſt, which is growing in many places of the Land, in private perſons gardens: but the third, I have not heard that it hath beene as yet brought unto us, it being as yet more rare, and as tender to keepe, if not more then the ſecond. The fourth is held doubtfull whether it came from the Eaſt Indies, *China*, or *Iapan*, or the Weſt Indies, for divers doe ſuppoſe the one and the other. The fifth groweth in *Virginia*, as Maſter *Tradeſcant*, who ſaw it there doth affirme, and from him I have a plant riſen of the ſeede. They all flower late, and none of them beare any ſeede with us.

The Names.

The *Arabians* call the *Iaſmine Zambach*, and *Sambach*, and *Iaſemin* as it is thought, from the Greeke word *Iaſme*, which ſignifieth *Violaceum*, it hath no other Greeke name, unleſſe as ſome thinke it be the *Pothos album* of *Theophraſtus*. The firſt is called *Iaſminum* or *Gelſeminum vulgatius & album*, by all Authours. The ſecond is called *Iaſminum*, or *Gelſeminum grandius & Catalonicum*, but by *Lugdunenſis Iaſminum puniceum*. The third is mentioned onely by *Ferrarius*, in his *Flora* or *de florum cultura*. The fourth by him alſo, yet mentioned in the Catalogue of the *French* Kings Garden at *Paris*. The fifth was never mentioned by any before, and but that Maſter *Tradeſcant* is confident to call it a Iaſmine, and therefore I am content to put it with the reſt to give him content, I would be further informed of it my ſelfe, before I would certainely give my conſent.

The Vertues.

Serapio delivereth it, that the white Iaſmine is hot in the beginning of the ſecond degree, that it diſcuſſeth humours, is good againſt ſalt flegme, profitable to old cold men, and profitable for catarrhs, and the griefes that ſpring from tough flegme: the leaves either greene or dry, doe cleanſe freckles, ſpots, and diſcolouring in the face or elſewhere, and helpeth tetters or ringwormes, and the like: it is not fit that thoſe that are of an hot conſtitution ſhould uſe this, for this breedeth the headache. The flowers are very ſweete, and therefore they ſerve to ſtrow in the houſe for an ornament and good ſent, they uſe alſo in the warme Countries to lay the flowers among their gloves

or fine linnen, to give the better ſent. The oyle that is made of the flowers by inſolation is good for any col part of the body to warme it, and to eaſe the paines of the crampe, and ſtitching in the ſides.

CHAP. LI.

Polemonium ſive Trifolium fruticans vel Iaſminum luteum vulgare.
Shrub Trefoile or the ordinary yellow Iaſmine.

ALthough as I ſaid in the Chapter before, this plant is not of the Iaſmines, yet becauſe it hath by time obtained that name, and that the flowers thereof in forme reſemble the white Iaſmine, I thought it good to joyne it next unto them, becauſe I would not put it into their Chapter. It ſpreadeth white rootes in the ground farre about, riſing up in ſundry places with many tall and ſlender twiggy branches, green at the firſt, but after of a darke grayiſh colour, whereon are ſet at ſeverall diſtances, three ſmall darke greene leaves together on every ſtalke, the end leafe being the biggeſt: at the joynts with the leaves come forth the flowers, each ſingly by it ſelfe upon a ſtalke which are long and hollow, ending in five leaves uſually, yet ſometimes in ſixe, very like unto the flowers of the white Iaſmine but yellow, and thereupon it was called a yellow Iaſmine, which being paſt, there follow other round blacke ſhining berries of the bigneſſe of a great Peaſe or Bigger, full of a purpliſh juyce which will colour ones fingers that ſhall bruiſe them.

Polemonium ſive Trifolium fruticans vel Iaſminum luteum vulgare. Shrubbe Trefoile, or the ordinary yellow Iaſmine.

The Place and *Time.*

This groweth plentifully about *Mompelier*, and abideth well any where in our Country: it flowreth in *July*, but we ſeldome ſee ripe fruite thereon.

The Names.

It is called *Polemonium Monſpelienſium* by *Geſner*, *Lobel*, *Camerarius* and *Lugdunenſis*, and *Trifolium fruticans* by *Dodonæus* and *Tabermontanus*, who alſo calleth it *Ruta baccifera ſive trifolia*, and *Geſner Ruta capraria Gallorum Monſpelienſium*, and by ſome *Iaſminum luteum Italicum*, yet *Columna* calleth it, *Iaſmini ſpecies trifolia non videtur ad Polemonium accedere*, *Beſler* in *horto Eyſtetenſi*, ſheweth one with foure leaves, that are greener, and not ſo ſharpe pointed, and *Bauhinus Iaſminum luteum vulgo dictum, baciferum*, who alſo giveth this note of it, that at *Mompelier* it is often found but with one leafe alone upon a ſtalke, although in Gardens it hath three. It is very doubtfull whether it ſhould be the *Polemonium* of *Dioſcorides* or no, for you have here the judgement of *Columna*, *non videtur ad Polemonium accedere*, although *Lobel* would make it agree in all things. Some would make it therefore a *Cytiſus*, but it agreeth thereto in nothing, but in having three leaves together. We cannot learne what *Italian*, *French*, or *Dutch* name it hath, but in *Engliſh* it may be called Shrubbe Trefoile, according to the Latine, but *Gerard* ſaith, it is called Make bate, yet I know not where nor by whom: it is uſually called now adaies the yellow Iaſmine from the likeneſſe of the flowers.

The Vertues.

We know not of any knowne property it hath for certaine, and therefore to give you the particular Vertues of *Polemonium*, when as peradventure not any one can belong thereunto, were needeleſſe, and the ground of a great errour.

CHAP. LII.

Syringa. The Pipe treē.

ALthough I have ſhewed you theſe five ſorts of Pipe trees in my formēr Booke, yet I thinke it not unfit to preſent you with them againe here, and give you a full deſcription of that ſort that was defective there.

1. *Lilac Matthioli ſive Syringa flore cæruleo.* The blew Pipe tree or Lilac.

The blew Pipe tree riſeth ſometimes to be as great as a meane apple, yet uſually it groweth nothing ſo great, having oftentimes ſuckers riſing from the roote, the younger branches being covered with a grayiſh greene barke, and the elder with a darker, having within them a pith like the Elder, with two faire broad, ſmooth deepe greene leaves, ſmall pointed at the ends, ſet at every joynt, which are ſome diſtance one from another, many of them folding the leaves inwards, ſtanding on long footeſtalkes: at the toppes of many of the branches come forth many long hollow blewiſh purple flowers, ending in five leaves, in a long tuft together,

2. *Lilac seu Syringa flore cæruleo.*
The blew Pipe tree or Lilac.

3. *Syringa Persica sive Lilac foliis incisis Periscam, Jasminum Persicum dictum.* The blew Persian Iasmine or Pipe tree.

4 *Syringa flore albo simplici.*
The single white Pipe tree.

5. *Syringa Arabica flore duplici.*
The double white Pipe tree.

ther, hanging downe, and are of a ſmall ſent; the flowers being paſt, there come ſometimes, but not often in our Country, long and flat cods, conſiſting as it were of two ſides, with a thin skin in the middle; wherein are contained two long flattiſh red ſeede: the rootes are ſtrong and grow deepe in the ground.

2. *Lilac ſive Syringa flore lacteo ſive argenteo.* The ſilver coloured Pipē tree.

This Pipe tree differeth not from the former, either in ſtemme or branch, either in leafe or flowers, or manner of growing from the laſt, but onely in the colour of the flower, which is of a milky ſilver colour, which hath a ſhew of blew therein, comming ſomewhat neere unto an aſhecolour.

3. *Syringa Perſica ſive Lilac Perſicum inciſis foliis Iaſminum Perſicum dictum.*

The blew *Perſian* Iaſmine or Pipe tree.

This *Perſian* Iaſmine (or *Perſian* Lilac, whether you will) is a ſhrub, or ſhrubby plant, never riſing into a tree like the former, yeelding many twigges, or ſtems and ſuckers from the roote, whoſe wood is ſoft having a pith in the middle, as the other, ſeldome riſing above a mans height, having a ſmooth blackiſh greene barke, with ſundry winged leaves thereon, on all ſides, ſome whereof as well thoſe below as above, will be whole without any diviſion therein, reſembling a Privet leafe, others will be cut in on the one ſide or the other, or both, and divers will be halfe like, or wholly like the poſture, and diviſions of the *Catalonian* Iaſmine reſembling it ſo neerely that thereby it came to be called a Iaſmine: at the toppes of the ſprigs and branches ſtand many tufts of flowers, in a long ſpike, of foure leaves a peece, ſo like unto the former Lilac, that at the firſt view of them you may truely, define it to be a Lilac, the colour onely excepted, which in this is more purpliſh, and of as ſweete a ſent or rather ſtronger: after the flowers are paſt, follow the like ſmall long blackiſh ſeede, incloſed in ſomewhat long and pointed huskes like the former but leſſer. This doth in every part, except the growth and leaves, come neereſt to our ordinary Lilac, and doth in nothing but the leaves reſemble a Iaſmine: for both the wood is white and pithy and the flowers grow in tufts or ſpikes, and appeare in *May* when no Iaſmine doth, but the Lilac: the ſeed likewiſe is contained in hard huskes, as the Lilac and not as the Iaſmine, like a Lupine, of a ſoft ſubſtance, and laſtly the taſte of this is ſomewhat harſh, with ſome aſtriction in the end, and the Iaſmine hath a bitter ſharpe biting taſte, and very aſtringent withall. Yet as I ſaid before, this is moſt likely to be *Serapio* his blew Iaſmine. The roote ſpreadeth many branches with fibres to them, under ground, and may very well be propagated by the ſuckers: this holdeth his greene leaves in the Winter, no more then the others doe.

This aſſuredly is the *Iaſminum caeruleum* of *Serapio*, whereof formerly there was great doubt among Herbariſts whether there were ſuch a thing in *rerum natura*, very many denying it, becauſe they either never ſaw this or never conſidered it.

4. *Syringa flore albo ſimplici.* The ſingle white Pipe tree.

This Buſh never beareth any great ſtem or body, but ſhooteth forth moſt uſually many pliant browniſh twigs or ſhootes, and grayiſh when they grow elder, being pithy in the middle like the former, at each joynt ſtand two leaves ſomewhat like the former, but more rugged or crumpled, a little pointed at the ends, and dented about the edges: the flowers grow at the toppes of the branches, many ſet together, conſiſting of foure leaves, as large as the Muske Roſes, and of the ſame creame colour, with many ſmall yellow threds in the middle, of a ſtrong ſweet, full and heady ſent, not pleaſing to a great many, by reaſon of the ſtrong quickeneſſe of the ſent: after which followeth the fruite, flat at the head, with many leafy ſcales compaſſing it, wherein is incloſed ſmall long ſeed: the rootes runne not deepe into the ground, but ſpread with many fibres thereat.

5. *Syringa Arabica flore duplici.* The double white Pipe tree.

The double Pipē tree from a ſhort thicke ſtumpe, not riſing high above the ground, ſhooteth forth divers long and ſlender branches, whereon grow large leaves, ſomewhat like unto the laſt, but not ſo rough or hard, nor dented at all about the edges, two alwaies ſtanding one againſt another at the joynts, but ſet or diſpoſed on contrary ſides, and not upon two onely; at the ends whereof come forth three or foure flowers, every one on a ſtalke by it ſelfe, which are long and hollow below, like the white Iaſmine, and have a double row of white round pointed leaves; five or ſixe in a row at the toppe, ſeeming like unto a double white Iaſmine flower but larger, with ſome yellowneſſe in the middle, which is hollow, of a very ſtrong and heady ſweete ſent like the ſingle kinde, and abide long flowring, eſpecially in the hotter Countries, but is very tender, and not abiding the leaſt cold weather with us, the cold windes greatly moleſting it in the hotter Countries, and muſt therefore be kept with us as charily as Orenge trees, or rather more.

The Place and *Time.*

The firſt groweth in *Arabia* as *Matthiolus* thinketh, who had it from *Conſtantinople*: but now is plentifully to be found in many Gardens of our Land as well as others. The ſecond is a ſtranger with us as yet. The third is very like to come firſt out of *Perſia*, as the name importeth, it is now to be ſeene with Maſter *Tradeſcant*, at South *Lambeth*. The fourth is almoſt as frequent as the firſt, but the originall place is not certainely knowne. The laſt hath the originall from *Arabia*, as the name importeth. The firſt, ſecond, and third, doe flower in *May*, the fourth in *June*, and the laſt later.

The Names.

Some have taken theſe to be kindes of Iaſmines, and that therefore the *Arabians Sambac*, doth as fitly agree to theſe as to the Iaſmines, for *Caeſalpinus* taketh the firſt, which *Matthiolus* called *Lilac*, and ſo divers others after him, to be the *Iaſminum caeruleum Mauritanorum*, or the *Liguſtrum Orientale* (neither of which it can be, for the *Cyprus Plinij*, as I have ſhewed you before, may moſt fitly be called by that name, and the blew Iaſmine is as I ſaid very probable to be the third, which we call the *Perſian* Iaſmine) *Cluſius*, *Camerarius* and others, call it *Syringa caerulea*, and *Lobel* and others *Syringa caerulea Luſitanica*, it is thought that *Bellonius* underſtandeth this plant, where he ſaith that the *Turkes* have a ſhrub with Ivy leaves alwayes greene, bearing violet blew flowers on a long ſpiked ſtalke many together, of the bigneſſe and faſhion of a Foxetale, and thereupon called Foxetale in their tongue, yet this of ours beareth not greene leaves in Winter, as *Bellonius* ſaith, *lib.* 3. *c.* 50. that doth, whether it doe therein differ from ours, or whether he be miſtaken, it reſteth doubtfull. Some as *Lugdunenſis* ſaith, have taken this plant to be the *Oſtrys* or *Oſtrya*, of *Theophraſtus*, becauſe it beareth ſmall ſeede like unto Barley, and ſome would have the white *Syringa* here ſet forth, to be his *Oſtrys* likewiſe for the ſame cauſe, but I have ſhewed you the true *Oſtrys Theorhraſti* before, as *Cluſius* hath ſufficiently declared it. The ſecond is remembred in no Authour

but

but the *hortus Eyſtetenſis*. The third is called by *Proſper Alpinus*, in his Booke *de plantis exoticis Ligustrum nigrum*, by which name it came firſt to *Bauhinus*, as he ſaith, out of *Italy*, and afterwards from *Signeur Contareni* his Garden, by the name of *Syringa laciniatis foliis*, which he altereth to *Ligustrum laciniatis foliis*, but it ſeemeth he had but onely a branch to ſee, without flower, as it is in his deſcription, and therefore could not further determine upon it, but I have often ſeene it both in and out of flower, and doe here give you both a full and true deſcription of the plant, and the name that both we and *Iacobus Cornutus* ſet it out by, in his Booke of *Canada* plants, *viz. Agem-lilag Perſarum*, which as he ſaith ſignifieth *Lilac Perſicum*. *Agem enim Perſideni ſignificat, & Lilac florem*, but came to us by the name of *Iaſminum Perſicum*, becauſe many of the leaves are formed very like thoſe of *Iaſminum Catolonicum*, as I have ſhewed you in the deſcription, yet the trueſt name to be impoſed on it, is *Lilac Perſicum*, as I have before ſhewed you, and this is that *Lilac laciniatis foliis*, that I gave you underſtanding of in my former Booke. The fourth is called *Frutex coronarius* by *Cluſius* and *Syringa alba* by all other Authours but *Lobel*, who calleth it *Syringa Italica*, not that he ever ſaw it growing naturally wilde in *Italy*, but that he there found it very frequent in their Gardens, *Bauhinus* calleth it *Syringa alba ſive Philadelphus Athenæi*. The laſt is called *Sambac Arabum ſive Iaſminum ex Gine*, ſo that it may not unfitly be referred to either, it is called *Syringa Italica flore albo pleno*, by *Beſler*, who ſet out the great Garden of the Biſhop of *Eyſtot*, although *Bauhinus* ſeeme to make two ſorts of it, as his cuſtome is in many other things, which it is likely he never ſaw, but upon *Alpinus* his reſembling the leaves unto thoſe of the Orenge tree, for thereby he maketh his diſtinction. We may call it in *Engliſh*, either the double white *Syringa* or Pipe tree, or the double white Iaſmine, according as it is in Latine, which you will, although the ſingle white hath nothing the like reſemblance in the flower to a Iaſmine.

The Vertues.

There is no uſe of any of theſe in Phyſicke, that I know, and are but as ornaments in a Garden, and for the beauty and ſweeteneſſe of the flowers there cheriſhed, unleſſe any would make a perfume of the flowers, by infuſing them in the Sunne with oyle of ſweete Almonds, or draw a Chymicall oyle out from the ſaid flowers, by diſtillation, onely the laſt *Alpinus* ſheweth the *Egyptians* doe uſe more for ornament to trimme up and perfume themſelves, then for to helpe them in their diſeaſes, neverthleſſe, they make ſaith he an oyle thereof, which their women uſe in their bathings to mollifie the hardneſſe and warme the coldneſſe of the mother, for by their experience they have found it to be very helpefull for hard kernels and tumours in the fleſh, and to cauſe a more eaſie and ſpeedy delivery in travaile of childbirth by drinking this oyle warme and annoynting the wombe alſo: Some uſe likewiſe to drinke that oyle warme, and to annoint the ſtomacke outwardly therewith, againſt the cough and ſhortneſſe of breath, and againſt the dangerous pleuriſie, where one can hardly bring up the flegme, or their ſpittle, and againſt Impoſtumations in the lungs, and againſt the violent paines in the ſtomacke, bowels, or privities: the oyle is made after the manner aforeſaid, either with oyle of Almonds or *Seſamum*, and the flowers ſteeped and ſunned.

CHAP. LIII.

1. *Oleander ſive Laurus roſea.*
The Roſe bay or Oleander.

THere is of this Roſebay two ſorts, the one with crimſon coloured flowers, the other with white, which are both ſo like in leafe and growing, that very hardly they can be diſtinguiſhed, before they be in flower, and therefore one deſcription ſhall ſerve for them both, and ſo might one figure alſo, but that I had them both ready cut in my hand, as I had many others, that are inſerted into this Worke. The ſtemme or trunke hereof groweth in time with us (but much more in the hotter climates) to be as big below as a reaſonable mans wriſt, and divideth it ſelfe upwards into many ſtalkes, three for the moſt part riſing at a place and from each of them likewiſe, three other branches, and ſo by degrees from three to three, as long as it groweth, the loweſt part of the branches being bare without leaves, and keeping them only at the tops al the Winter, being long & ſomewhat narrow, more like to thoſe of the Peach, then Bay tree, but thicker and harder, of a darke greene above and yellowiſh below, the flowers come forth at the tops onely of the branches, of a deepe crimſon colour while they are in the bud, and being blowne conſiſt of foure long and narrow leaves, with round ends, ſomewhat twining themſelves, of a paler red colour, tending to a deepe bluſh, and in the other are white, without any mixture of other colour therein, but the greene leaves are paler or freſher: after which come long crooked pods, hard or wooddy almoſt on the outſide, and browne in the hot Countries, but was never ſeene to beare ripe pods. I thinke in our Country wherein is contained browniſh flat ſeede, wrapped in a great deale of moſt fine browniſh yellow downe, as fine almoſt as ſilke, the pods being ſomewhat like unto the pods of *Aſclepias* or *Periploca*, but larger, flatter, and harder.

1. *Oleander flore rubro.*
The Role bay with red flowers.

2. *Nerij*

1. *Oleander flore albo.*
The Roſe bay with white flowers.

2. *Nerij facie arbor Indica.*
An Oleander-like Indian tree.

2. *Nerij facie arbor Indica.* An Indian Oleander-like tree.

Becauſe *Lobel* onely hath ſet forth this branch comparing it to the Oleander, I thought good to joyne it next thereunto, although wee have no further knowledge thereof then his relation which is thus. Seven or nine of theſe together like unto ſheathes of leather, a foote, or a foote and a halfe long, every one of them reſembling a ſlender Lamprey, did hang downe from one place of the branch, which was like a pithy Marſh Elder knotty pale browne ſticke, ſo nearely reſembling the caſt skin of a Snake, or the dead body it ſelfe, that it might very well fright children therewith, although ſtuffed on the inſide with woolly skins, at the ſame knot with theſe skins came forth ſome flowers, growing out of ſmall huskes, as the figure expreſſeth them unto you.

The Place and *Time.*

The firſt with red flowers groweth in *Greece, Spaine, Italy, &c.* in many places but that with white in no place but *Candy*, that we can heare of, and flower in *July*, the other is an unknowne ſtranger.

The Names.

It is called in Greeke Νήριον, ῥοδοδάφνη, ῥοδόδενδρον, *Nerium*, and *Rhodendron*, and *Rhododaphnes*, and ſo alſo in Latine by moſt Authours, but *Laurus Roſea* by *Apuleius* and *Lobel*, and *Rhododaphne* by *Camerarius*. The laſt is ſo entituled and deſciphered as I here ſet it downe.

The Vertues.

We have nothing to relate of the laſt, but of the Roſe bay. *Dioſcorides* ſaith it is death to Mules, Dogs, Aſſes, and many other foure footed beaſts, that ſhall eate thereof, but that it helpeth men that are ſtung by Serpents, the leaves and flowers, being taken in Wine, but *Galen octo. ſimplicium*, ſeemeth contrary hereunto, ſaying that outwardly applyed, it hath a digeſting property, but inwardly taken it is deadly, both to man and all ſorts of cattle. *Matthiolus* therefore to reconcile theſe two ſayings, finely defineth *Dioſcorides*, to underſtand ſuch men as are bitten or ſtung by Serpents, *Galen* by ſuch as are in health and not ſtung: For after the ſame manner, *Cantharides* ſaith *Avicen*, doth helpe thoſe that are bitten by a mad dogge, and *Euphorbium* by the Scorpion, and ſo likewiſe divers other dangerous or deadly medicines, reſiſt the venome of other things: But *Cordus* would interpret it another way, that is, that taken inwardly it was poyſon, but outwardly applyed it did reſiſt it, and ſaith moreover that the flowers are deadly, but in ſome places and at ſome times. Yet *Dioſcorides* words are plaine, inwardly taken and drunke in Wine, with ſome Rue, and ſo *Pliny* alſo relateth it, as taken from *Dioſcorides*. *Galen* ſaith that the chiefe Champions in Wraſtling and Running had their backes paid with Roſe bayes. The Honey of *Pontus* alſo was accounted deadly, becauſe the Bees there fed on the flowers hereof, as well as on thoſe of *Acomite*. *Lucius Apuleius* in his Aſſes forme, and *Lucian* alſo, as they write of themſelves, had like to have caught their banes by miſtaking the flowers, hereof for Roſes, which ſhould have holpen them.

CHAP. LIV.

Cytiſus. Tree Trefoile.

HAving in the laſt Chapter ſhewed you a Trefoile Iaſmine, which ſome as I ſaid, take to be a *Cytiſus*. I thinke it not amiſſe to ſet downe the kindes of *Cytiſus*, next unto it, and becauſe there is ſuch diverſity among them, I would diſtinguiſh them into two ſorts, that is, into the right *Cytiſus*, and thoſe that come neereſt unto it: and into a baſtard kinde, that is ſome that are very unlike in many things, although like in ſome, and others like in many yet unlike in ſome: the ſweetneſſe in their taſte and whiteneſſe in their leaves and ſtalkes, declaring their nighneſſe unto the true ſort: their blackneſſe and bitterneſſe, to the baſtard kindes: of the firſt we will ſpeake in this Chapter, and of the other in the next.

1. *Cytiſus Galeni creditus, Maranthæ Cornutus.* The ſuppoſed true *Cytiſus* or horned tree Trefoile.

This *Cytiſus* (as *Galen* ſaith groweth to the height of the Myrtle, or as *Pliny*, *Columella*, and *Strabote*, to the heighth of a meane tree) which many tooke as *Lugdunenſis* ſaith, for no other then the *Medica Lunata*, and is yet deſcribed by *Beſler*, as it grew in the Biſhop of *Eyſtot* his Garden (to be in ſome ſort anſwerable to what *Matthiolus* ſetteth forth of it, for acknowledging his former errour, in miſtaking the *Trifolium caballinum* to be *Cytiſus*; and finding in *Galen Cytiſus* was a ſhrub and not an herbe, he ſheweth this plant, which he received from *Cortuſus* as the right, and therefore could be no *Medica*, which is a ſmall creeping herbe, as all the ſorts are) and groweth to be two cubits high, covered with a grayiſh or aſh-coloured barke, the wood whereof is firme and hard: the leaves are hoary white, as is the whole ſhrub, and grow without order three together on long footeſtalkes: the flowers are of a gold yellow ſhining colour like unto Broome: the ſeede groweth in broad crooked cods.

2. *Cytiſus Creticus incanus ſive Ebenus Cretica Belli.* *Candy* tree Trefoile, or *Candy* Ebony.

This *Candy* plant riſeth up to above a mans height, that is, foure or five cubits growing writhed or crooked, and of the thickneſſe of ones arme, covered with an aſh-coloured barke, the leaves are gray or white, longer and narrower then the former, and grow not alwayes three, but ſometimes foure or five, upon a long footeſtalke, the flowers grow at the ends of the branches, in a tuft together like unto thoſe of the Medow Trefoile, or common three leaved graſſe, of a gold red colour, and greater then they: in the middle of each flower ſtand many ſilver white ſhining threds, as fine as haires, ſet in grayiſh huskes, wherein the ſeed is incloſed afterwards, which is like unto that Trefoile likewiſe: the wood is very firme and maſſie, and of the colour of blacke Ebony, from whence *Honorius Belli*, did call it ſo.

3. *Cytiſus incanus Germanicus.* The *Germane* hoary tree Trefoile.

This *Germane Cytiſus* ſhooteth from the roote ſundry ſlender hoary ſtalkes, with three ſomewhat long leaves, at ſundry places of them ſomewhat hoary alſo on the backeſide, more then on the upper part, the middle rib being ſomewhat great, of a kind of ſweetiſh taſte, and a little ſweete in ſent alſo: the flowers are yellow like the other ſorts or Broome flowers, ſtanding many together one above another at the end of the branches, after which follow hairy, and ſomewhat hoary, little long, narrow and flat cods, containing therein ſmall ſeed like broome, taſting like a Vetch: the roote is wooddy, diſperſing it ſelfe under ground divers wayes.

1. *Cytiſus Galeni creditus Maranthæ Cornutus.*
The ſuppoſed true Cytiſus or tree Trefoile.

4. *Cytiſus Hiſpanicus arboreus.*
The *Spaniſh* tree *Cytiſus*, or tree Trefoile.

This Cytiſus riſeth up with one ſtemme uſually, covered with a darke grayiſh barke to the height of a man, ſaith *Cluſius* in *Spaine*, but higher with us, ſpreading ſundry ſhort branches all about, whereon are ſmall pale greeniſh Trefoile leaves, on the upper ſide, and ſet with a little reddiſh hairyneſſe underneath, the yellow flowers are ſomewhat longer then others, and come forth at the foote of the leaves, in ſundry places, uſually two or three at a place, which turne into ſmall ſhort and flat cods, leſſer then Broome cods, and ſomewhat blackiſh when they are ripe containing ſmall flat and blackiſh ſeed within them: as ſmall as Broome ſeed, as we have obſerved them, although *Cluſius* ſaith hee ſaw none.

5. *Cytiſus incanus major foliis pinnatis ſive quinti ſpecies altera Cluſij.*
The great hairy tree Trefoile.

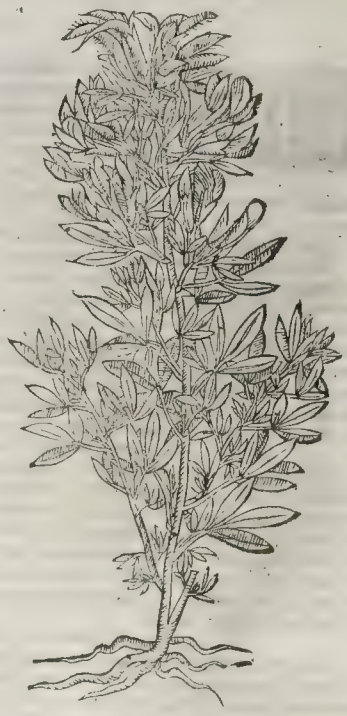
This groweth greater and more upright then the third by much, whoſe branches alſo are thicker and more hairy: the leaves are twiſe as big, the flowers of a deeper gold yellow colour and the cods larger.

6. *Cytiſus Hiſpanicus incanus ſive ſextus Cluſij.*
The low *Spaniſh* hoary *Cytiſus*.

The ſhootes of this Cytiſus are not above halfe a yard long, ſlender and hoary, whoſe Trefoile leaves on them have the two loweſt ſmaller then the middlemoſt, which is twiſe as long, but of an hoary aſh-colour, ſtanding on ſhort footeſtalkes, of an aſtringent drying taſte, the flowers ſtand with

2. *Cytisus Creticus inermis sive Ebenus Cretica Bell.*
Candy tree Trefoile or Candy Ebony.

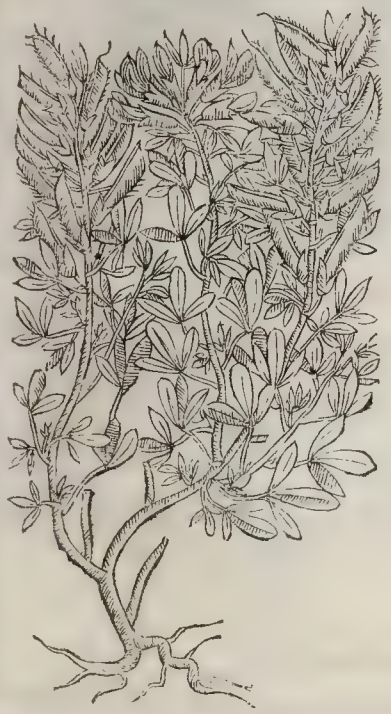
3. *Cytisus incanus Germanicus,*
The Germane hoary tree Trefoile.



4. *Cytisus Hispanicus arboreus.*
The Spanish tree Cistus or tree Trefoile.

6. *Cytisus Hispanicus sextus Clusij,*
The low Spanish hoary Cistus.

7. Cytisus Austriacus sive septimus Clusij.
The Austrian or Hungarian low Cytisus.



10. Cytisus octavus Gerardi.
Gerard his eighth Cytisus.

the leaves at the joynts all along the branches, two or three together sustained by soft hoary white huskes, wherein they stand, why *Gerard* should call this kinde *semper virens*, and his Corrector after him so to let it passe, I know not, for neither *Clusius* first set it forth, nor any since him that have written of it, have so related it.

7. Cytisus Austriacus sive septimus Clusij. The *Austrian* or *Hungarian* low Cytisus.

The slender lithy twigges of this Cytisus are pliable and hard to be broken, lying on or neare the ground, which are bare of leaves, unto the branches whereon they stand without order upon long footestalkes, shorter and greener then those of the third or *Germane* sort, and more hairy, greenish above and gray underneath: the flowers grow two or three at a joynt as the last and at the ends of the branches also, yellow at the first, but before they are quite past, turne more gold yellow, so deepe that they seeme red withall: the cods are small flat and hairy, with small browne seede within them.

8. Cytisus Pannonicus sive septimi species altera Clusij The hoary low Cistus.

This is somewhat like the last in the slender pliable twigs, leaning downe to the ground and leaves like them: the flowers also are like unto them, but stand foure or five together, at the ends of the branches, and not at the joynts as in the last: the cods and seede differ not there-from, but the leaves are a little hoary, and so are the cods also.

9. Cytisus albicans Alpinus. The whitish mountaine Cytisus.

There is little difference in this, as by the notes thereof appeareth from others in the branches or leaves; but that at some places two or three trefoile leaves, are set at a joynt, and the flowers are paler.

10. Cytisus octavus Gerardi. *Gerard* his eighth Cytisus.

Gerard and his Corrector after him, mention this Cytisus as taken from *Lobel* and *Pena*, when as it agreeth with neither of those that are extant in their *Adversaria*, neither doth *Bauhinus* quote him for it, as he doth all others that he knew; for the eighth of *Tabermontanus*, which might seeme to be this, *Bauhinus* noteth to be his *hirsutus*: the chiefest difference therein as *Gerard* saith, is in the leaves, which are a little dented on the edges, which yet are not seene in the figure.

The Place and *Time.*

The first of these *Bartholmeus Maranta* found in *Naples*, and *Honorius Bellus* in *Candy*, as he did the second also: all the rest, except the sixth and last were found by *Clusius* in *Hungary*, *Austria*, and the parts thereabout: they all flower in the Spring of the yeare, but some earlier and some later, and give their seede in *August* and *September.*

The Names.

It is called in Greeke κύτισος, and *Cytisus* in Latine, a *Cythnio insula*, as *Pliny* saith, from whence it was carryed to the *Cyclades*, to the Greekes, and after to the Latines, for the wonderfull fruitfullnesse it procureth both in men and cattle, but especially in their heards and flockes: the former times as *Matthiolus* and *Tragus* shew, by their

mistakings

mistakings of the true *Cytisus*, were smally verst in the knowledge of plants, in that for the most part, whatsoever herbe offered it selfe next to hand, that had but some shew like the true, it was presently accepted for true, although after upon better examination it proved farre short thereof. The first of these is the *Cytisus Marantha* of *Matthiolus*, *Lobel*, *Lugdunensis*, and all others, and taken by *Camerarius* and others, to be the *Cytisus verus* of *Galen*, *Dioscorides*, &c. the *Italian Pona*, confounded this and the next together, as *Bellus* seemed to doe also, in calling it *Cytisus Creticus*, which he said is like unto that of *Marantha*, yea it is the same as he thought, having the like crooked cods, to be the *Ebenus Cretica*, but he afterwards corrected himselfe, in that it differeth much in the heads of flowers and seede, from that of *Marantha*, but *Bauhinus* saith, he received from *Bellus* branches of each of these to shew the difference, so that this first is the *Lignum Rhodium*, or *Cytisus verus*. And the second is that which he first called *Cytisus Creticus*, and by the *Cretanes Archontoxylum*, that is, *nobile lignum*, which for distinctions sake he calleth *Ebenus Cretica*. The third is the first *Cytisus* of *Clusius* in his history, and the *Cytisus prior* of *Lobel*, and likewise the *Cytisus albus sylvestris* of *Cordus* in his History, although *Bauhinus* doth sever them into three sorts, as who so will heedefully marke them, shall soone see that there is no such difference in them, to cause them so to be severed. The fourth is the third *Cytisus* of *Clusius*, which *Lobel* and *Lugdunensis* call *quartus Hispanicus*, because it is so in his *Spanish* Observations, but we take them all in this worke, according to the numbers expressed in his History of plants, as I have shewed you in divers places before. The foure last sorts have in their titles, the number that you shall finde them in *Clusius*.

The Vertues.

The leaves of all these sorts (for it is probable they doe not one differ from another) are cooling, and doe dispersse tumours, and hard swellings, if they shall be beaten with bread and so applyed, the decoction of them being drunke, provoketh urine, for as *Galen* saith, the leaves have a digesting quality, with some temperate humidity in them also, as Mallow leaves have, *Columella* sheweth that in former ages, there was much profit made by the feeding of sheepe herewith to give store of milke, and not onely to fatten them, but Bullockes and Goates also, and Hens, and all other sorts of cattell: but was planted also for Bees to feede on, as from whence they did gather more honey, then from any other plant whatsoever, and besides it abideth greene eight moneths of the yeare for their pasture, and may be kept dry the rest of the yeare following, as the dry fodder: if women that be Nurses have not any store of milke in their brests, let them steepe some of the leaves and young branches hereof in faire water all night, and being strained forth in the morning, let them take three parts thereof, with a fourth of wine, which will breede good store of milke in them, and make their children strong and able: the dryed leaves steeped all night in water, and boyled afterwards, strained and drunke is as effectuall as the juyce.

CHAP. LV.

Pseudocytisus. The bastard or base trēe Trefoile.

THere are divers sorts also of this base or bastard kinde to shew you, whereof onē is the most adulteratē of them all, which therefore shall be last expreset.

1. *Pseudocytisus Hispanicus primus.* The first *Spanish* base tree Trefoile.

This first base tree Trefoile groweth up to the height of a small tree, whose body and branches are covered with a grayish barke, the younger twigges being hoary white, the leaves are many, and smaller then in any other sort of Cytisus, three alwayes set on a stalke, of a pale greene colour, and abiding in the Winter, contrary to any of the rest, of a bitterish taste, the flowers are yellower and smaller then Broome flowers, standing as it were spike fashion at the end of the branches, after which come rough hairy long pods, wherein is thicke flattish blacke seede, smaller then that of Broome: the roote is wooddy and spreadeth divers wayes, the wood is firme and yellowish.

2. *Pseudocytisus Hispanicus secundus.* The second *Spanish* base tree Trefoile.

This second *Spanish* sort, riseth not much above a yard high, full of shootes from the rootes, which are branched forth and wholly white, having hoary Trefoile leaves, never open but as it were folded together, the middle rib being great, of an extreame bitter taste: the deepe yellow flowers, are somewhat sweete and stand at the end of the branches like the former and the peds that follow are long and rough, of a blackish purple colour, the points being turned downewards, with greater and blacker seede in them: the roote is like the former.

3. *Pseudocytisus niger.* Blacke base tree Trefoile.

This base tree Trefoile groweth with the limber pliant shootes, it bringeth forth not so high, but straighter and greater then the last, the barke of them being of a darke grayish colour, beset with small Trefoile leaves, somewhat round, and a little bitter in taste, and of a darke greenish colour, the flowers grow at the toppes of the stalkes many together spike fashion, of a yellow colour and pretty sweete sent, like unto honey, the cods that follow are somewhat long and flat, with browne seede in them.

4. *Pseudocytisus foliis subrotundis.* Base tree Trefoile with roundish leaves.

The stem hereof hath sundry branches growing forth from it, and set with small roundish darke grēene leaves, upon very short footestalkes: the flowers, are smaller then those of Broome, and yellow, but more store set together at the ends of the branches, then the smallnesse of the plant might seeme to beare, of a pretty sweete sent, and a pulselike taste, the pods and seede are small like the last.

5. *Pseudocytisus Hispanicus Bauhini.* *Bauhinus* his *Spanish* base tree Trefoile.

This *Spanish* base tree Trefoile hath hard round striped stalkes, foure or five foote high, branched into sundry branches, somewhat woolly, stored with divers small Trefoile leaves, of a pale greene colour, the flowers are small and yellow like the others, unto which succeede many small pods like unto those of Birds-foote, three, foure, or five joyned together on a stalke, with small flat blackish seede in them: this is not the same with the first of these base tree Trefoiles here set downe being much different.

6. *Cytisus facie quibusdam Alissum fruticans.* A Cytisus-likē unlike plant.

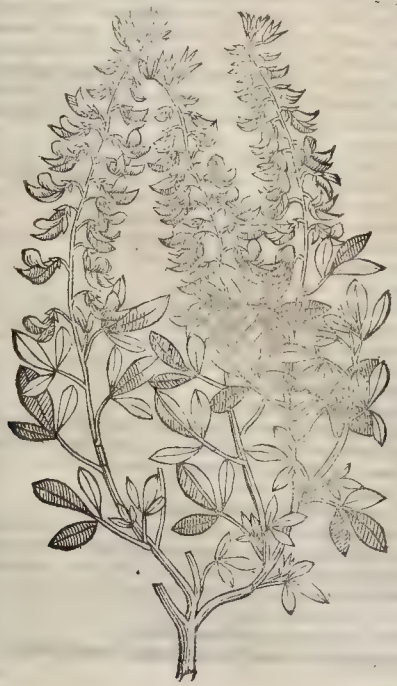
Because others before me have placed this plant as last of the Cytisus, so must I for this time, which else might

in

1. *Pseudocytisus Hispanicus primus.*
The first Spanish base tree Trefoile.

2. *Pseudocytisus Hispanicus secundus.*
The second Spanish base tree Trefoile.

3. *Pseudocytisus niger.*
Blacke base tree Trefoile.



4. *Pseudocytisus foliis subrotundis*
base tree Trefoile with roundish leaves.

in some sort have beene set with the other *Alyssa*, the description whereof is thus. From a tough wooddy roote grow up sundry pliant hoary greene stalkes, spreading into branches, set with divers hoary greene leaves together, contrary to all the other *Cytisi's*, yet each leafe by it selfe, somewhat like unto them, but thicker and hairy also, the flowers are many and yellow, that stand at the toppes, spike fashion, composed of foure leaves like to Stocke Gilloflowers, after which come seedes in round pods.

The Place and Time.

Three of these grow in *Spaine*, the former two found by *Clusius*, and the last by some other, the other two in *France* and *Germany*, and flower and seede in the time of the former.

The Names.

The first of these is the first *Cytisus* of *Clusius*, which *Lobel* and *Lugdunensis* call *Cytisus Hispanicus primus*, by *Dodoneus Pseudocytisus prior*, and *Bauhinus Cytisus minoribus foliis ramulis tenellis villosis*. The second is *Clusius* his second *Cytisus*, called also *Cytisus secundus Hispanicus* by *Lobel* and *Lugdunensis*, and by *Dodoneus Pseudocytisus alter*. The third is the *Pseudocytisus seu niger Cordi*, the *Cytisus niger sive major* of *Camerarius*. The fourth *Cytisus* of *Clusius*, the *Cytisus minor* of *Gesner*, which *Lugdunensis* calleth *Cytisus Gesneri*, and by *Bauhinus Cytisus glaber nigricans*. The fourth is the *Cytisus alter minor* of *Lobel*, which *Eystetensis* calleth *Trifolium arborescens*. The last *Bauhinus* onely hath described in his *Prodromus*, by the same title I doe here give it you.

The Vertues.

We have nothing recorded of any particular, any of these base shrubbes are indued withall, and although some may thinke, that they are of the same quality with the former, I am not of that opinion, in regard they are all much more bitter then the former, and some intensively bitter, which can be no helpe to encrease milke, in any creature, nor yet to fatten them as the former doe.

6. Cytisus facie quibusdam Alissum frutescens.
A Cytisus-like unlike plant.

Chap. LVI.

Cupressus. The Cypresse tree.

Some doe make two sorts of Cipresse trees, the male and the female, the one that spreadeth more then the other, which groweth more upright, not much differing in any thing else, which maketh me thinke the diversity riseth from the soyle or some casualty, and that the male which spreadeth is not a distinct *species*, which preserveth the kinde naturally as all other things doe, especially seeing as *Theophrastus* saith, the one doth degenerate into the other, and that both doe beare nuts and seede alike. I shall therefore under one make mention of both sorts, if they be so, and shew you that the Cypresse groweth to be a great tall upright tree, spreading out the branches so even round about, that it seemeth to be so formed by Art, being small below, not farre above the ground, then spreading out larger, yet keeping a round close compasse and afterwards spiring up to the toppe, lesse and lesse, very well representing a *Piramis* or Spire steeple, the body and armes are covered with a reddish barke, the leaves are ever green, but loosing much of the verdure in Winter, which it regaineth the next Spring after, and somewhat long, slender, and flattish round, parted very much and somewhat resembling Savine, of a resinous sent and strong taste: some trees are seene in some places to be more spreading in their branches, and not abiding so close, especially when they grow old, and doe beare their small yellow flowers, and their fruite, or nuts, as they are called afterwards, which grow here and there among the boughs, cloven or opening into divers parts growing ripe, but close and hard while they are young, of a russet browne colour, wherein are contained small browni sh seede, but not so small as motes in the Sunne, as *Matthiolus* and others make them to be: the roote spreadeth much, but not very deepe: the wood is reddish, very firme and durable, not subject to corruption or wormes, but defending all other things, by the strong heady sent it hath, from all mothes and wormes, it yeeldeth out of the body of the tree, a kinde of liquid Rossen, like unto that of the *Larche* and Turpentine trees, of a very quicke and sharpe taste.

2. *Cupressus Americana.* The Cipresse tree of *America*.

Although I doe not take this to be a true Cipresse tree, yet because it hath obtained that name by all our travellers into the hether or Northerne parts of *America*, where it is found in sundry Countries thereof, let me joyne it here untill by a better regard I may place it in a fitter. It groweth in some places to be a very goodly tall tree, fifty, sixty, yea eighty foote high, without any branch, and neere three fathome compasse at the lower end, and then spreadeth sundry large armes and branches, beset with many winged leaves, which are very fine, small, smooth, plaine, and not square, crumpled or plaited as the true Cipresse is, and somewhat longer also, set on both sides of the stalkes, without any certaine order, being not alwaies opposite: the nuts are somewhat like those of the Cipresse but greater, with thicker, more open scales and greater seede within them. The wood smelleth some-

what

what sweete, which in part caused it to be termed a Cipresse. Whether this should be that *Thuja*, of *Theophrastus*, *lib.* 8. *c.* 15. that is both in stocke, branches, leaves, and fruite, like unto the wild Cipresse, it were somewhat worthy to be scanned, whose fruite it is likely, is that *Habbel*, that *Faludanus* brought home with him in his returne from his travailes, and said it was so called in the East Countries, the figure, wherof I here give you with this branch: the nut it selfe doth much resemble the nut of this, both for forme and large thickenesse of the scales. This looseth his leaves in Winter.

The Place and Time.

The ordinary Cypresse tree, groweth in sundry of the warme Countries, of the Levant, eastwards, and in many of the Iles likewise in the *Mediterranean* Sea, as *Rhodes*, and *Candy*, where it is so familiar to the soile, that it springeth up every where, of it owne accord, in the Mountaines *Ida*, and *Leuce*, if the ground be stirred a little, and that nothing else be sowne thereon, and beareth ripe fruite from *September*, almost all the Winter. The other is as is said, in sundry Countries of the North *America*, whose seede was brought by Master *Tradescant* from *Virginia*, and sown here, doe spring very bravely.

The Names.

It is called in Greeke κυπάρισσος and κυπάρισσος ἀπὸ κύειν παίσουσι τὰς ἐκφερούσας, *id est, a partu parilium ramorum*, in Latine *Cypressus*, and *Cupressus* also. The *Arabians* call it *Saro*, and *Sera*, the *Italians Cypresse*, the *Spaniards El Cypres*, the *French*, *Dutch*, and *English*, *Cypres*, and the *Germanes Cypressen*.

The Vertues.

The Cypresse cooleth, bindeth, and dryeth without either heate or biting sharpenesse, but so much as may put the acerbity in action, yet it doth resolve and consume humidities, in putride ulcers, the pouther of the leaves with a little Myrrhe and wine, helpeth those fluxes that fall on the bladder, and provoketh urine being stopped, and without Myrrhe the fluxes also of the belly or stomacke, bleedings, and spittings of blood: the decoction of them, performeth the same likewise, it helpeth also the cough, and shortnesse of breath, by taking fasting a small draught, and if the like draught be taken every morning for many dates together, it will helpe the rupture, so as some of the fresh leaves be applyed also to the place, and well bound on; which things the nuts do performe more effectually, and in all fluxes of blood and humours: the small chips or rasping of the wood, taken in Wine provoketh womens courses, and helpeth the biting of the Scorpion, as also procureth a good colour to the whole body: the leaves bruised and laid unto fresh wounds that bleede much, doth stanch the bleeding, and so consolidateth the wound: being used by themselves, or with fine Barley meale, it helpeth Saint *Anthonies* fire, creeping ulcers, and carbuncles and the sores and ulcers of the privy parts in man or woman, and helpeth the inflammations of the eyes, and applyed with acerote to the stomacke doth much comfort and strengthen it against castings, and other the passions thereof upon defluxions of sharpe

1. *Cupressus major sive fatiosus.* The Cypresse tree.

2. *Cupressus Americana, an Thuja Theophrasti Cupresso similis, cui ut fructus Habbel huic assimilatur.* The American or Virginia Cypresse with the fruite Habbel of *Clusius* which is like unto this.

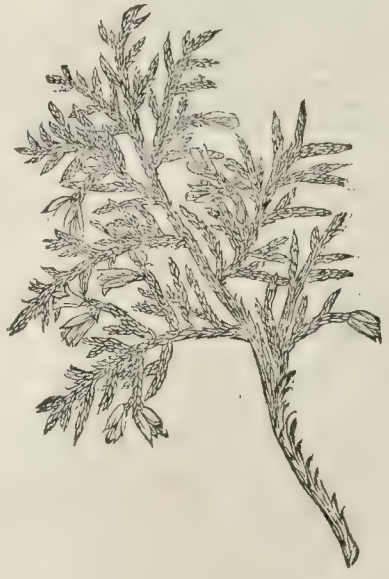
humours thereon, the leaves beaten with some dry figges, doe mollifie the hardnesse of tumours, and of the testicles, and consumeth the *Polypus* of the nose, which is an excrescence or peece of flesh growing therein: the same also boyled in vinegar and made up with the meale of Lupines, causeth rugged nailes to fall away, and helpeth the tooth ache, the mouth being often washed therewith: the same also taketh away the Morphew, freckles, spots, and the like in the skinne, the nuts boyled in Wine, and the haire washed therewith, causeth them to grow black, and if the ashes of them be mixed with the pouther of a Mules hoofe, and oyle of Myrtles, it will stay the falling of them: the branches and nuts of the Cypresse being burned, driveth away gnats, and other such like troublesome flyes: the leaves being laid among seedes of any sort, will keepe them from being eaten with wormes, and the wood in Wardrobes will preserve garments from Mothes: the wood it selfe is in no age subject to the worme, neither will the sent decay in many yeares, and therefore much desired in chests and boxes, *Thevet* reporteth that he saw at *Damiate* in *Egypt*, a Cypresse chest that was digged ten foote deepe out of a moorish ground, and found uncorrupt in any part, which as was likely had lyen there since *Sultan Selim* subdued *Egypt* in the yeare 1512.

CHAP. LVII.

Arbor Vitæ. The tree of life.

THis tree being in some sort like unto the Cypresse, I thought good to joyne next thereunto. It riseth to be a reasonable great and tall tree, standing long in a place, covered with a darke reddish barke on the body, but more red on the branches, spreading many branches, and many small twigges bending downewards, which and the long leaves, that come from them, on both sides are flat, and plaited or braided, as it were like a braided lace, of a darke yellowish greene colour, soft and not hard or pricking, abiding greene, alwayes smelling without falling away, and tasting somewhat strong and resinous, not pleasing to many, but ready to provoke casting, yet very cordiall, and pectorall also to them that can endure it, at the ends of the branches come forth small mossie yellowish flowers, which turne into small scaly yellowish heads, wherein lie small and long browniish seede: the wood is firme and hard, and of a browniish colour.

Arbor Vitæ. The tree of life.



The Place and *Time.*

It first was brought from *Canada* by the *French*, in King *Francis* the first his time, and presented to him, and from the encrease thereof, is spread sufficiently through all the Countries neere it, and flowreth in *Aprill*, and *May*, and the fruite is ripe in *August* and *September*.

The Names.

This being a new found tree, hath no true, auncient Greeke or Latine name to call it by, for although most that have written of it, referre it to the *Thuja* of *Theophrastus*, *lib.* 5. *c.* 5. which he compareth both in branches leaves and fruite, unto the Cipresse tree, yet *Omne simile non est idem*, and although it hath some likenesse in the leaves, yet so it is not in the fruite, and I verily beleeve, that it is *proprium sui generis*, not to be parallelled, or made the same with any other we have, as most of the trees and herbes of *America*, are not equall to those that grow in *Europe*, the hether part of *Africa* and of *Asia* the lesse, as experience sheweth. *Lugdunensis* maketh it to be his *Thuya tertium genus*. Some would make it a kinde of *Cedrus Lycia*, but that beareth red berries, which this doth not. Some also have called it *Arbor Paradisea*: but it was presented to the *French* King by the name of *Arbor Vitæ*, but upon what reason or ground I know not, but ever since it hath continued that name of the tree of life. *Clusius* and *Bauhinus* say, that some would referre it to the *Bruta arbor Plinij*, but that as he saith hath whitish branches, and sweete being burned.

The Vertues.

Although we have no forraigne experience to report unto you, yet upon tryall of the leaves by some in our owne Land, we have found that they that were long time troubled with a purulentous cough, and shortnesse of breath, have beene much releived and holpen thereof, by the use of the leaves taken fasting with some bread and butter, as the most familiar way for some few dayes together, thereby expectorating the flegme stuffing the lungs, and so cleering the passages, as they found much good by it, and doubtlesse the resinous smell and taste, abiding dryed as well as fresh, doth evidently declare the tenuity of parts therein, and a digesting and clensing quality, which if any would put into action they should soone see the effect.

CHAP.

CHAP. LVIII.

Tamariscus. The Tamariske tree.

I Have three or foure sorts of Tamariske, to bring to your consideration, one whereof was never published or made knowne to the world, before I gave you a hint thereof in my former Booke, which I meane to ranke with the rest here.

1. *Tamariscus folio latiore,* The *Germane* or broader leafed Tamariske.

The broader leafed Tamariske groweth but low in sundry places, over that it doth in other, for I have observed it growne in some places where it hath stood very many yeares to be a reasonable great tree, whose barke was somewhat thicke and rugged, of a darke reddish colour, the younger shootes being reddish at the first, greene after, and blackish when they are dry, beset all about with fine long darke greene leaves, as it were crisped, because they are so small and short, that stand about the longer, yet are they greater and broader then the *French* kinde: at the end of the young shootes come forth a long spike of flowers and leaves among them, each flower being made of five purplish leaves like threds, divers of them standing in a greene huske together, in which huskes when the flowers are past, grow seede lying among them, which together are carryed away with the winde: the leaves fall away every Autumne, and spring anew in the Spring.

Myrica sive Tamariscus specierum.
Tamariske of three sorts.

2. *Tamariscus foliis albidis.*
White Tamariske.

Of this kinde I have seene another sort very beautifull and rare, brought me by Master *William Ward*, the Kings chiefe servant in his Granary, from his house at *Boram* in *Essex*, whose branches were all red, while they were young, and all the leaves white, abiding so all the Summer, without changing into any shew of greene like the other, and so abideth constantly yeare after yeare, yet shedding the leaves in Winter like the other.

3. *Tamariscus folio tenuiore.*
The *French* or finer leafed Tamariske.

This finer leafed Tamariske doth in many places grow but into a small shrubbe also, but in others into a great thicke and tall tree, with many spreading armes and branches, whose leaves are set in the same manner, and grow after the same fashion, but finer and smaller like unto Heath, of a grayish greene colour: the flowers are smaller, and grow spike fashion like the other, being purplish at the first, but white when they are blowne open, consisting of five leaves apeece, which turne into downe with the small seede in them, and falleth away as the Willow and Poplar doe, but *Lobel* saith, they turne not into downe, but the fruite is round like Ollive stones, which as he saith being laid in the Sunne have stirred to and fro for three dayes together, having a worme within them, which was the chiefe cause of the motion, and having made a hole in the graine commeth forth: which of these is truest, seeing both affirme the matter as eye-witnesses of the relation, I know not, never having seene the tree beare out his fruite or seede with us.

4. *Tamariscus Ægyptia gallæ ferens.* The *Egiptian* Tamariske.

This tree groweth in *Egipt*, and other places of *Syria*, *Arabia*, and *Turkie*, as *Bellonius* saith, who observed it to be a wondrous great and high tree, growing as well in dry ground as in moist, whole woods of them growing together in each soile, whose kind is of this last described, but besides, it beareth small hard excrescences, like unto great Gaules, of divers formes, some longer, some shorter, some broad, others thicke or slender.

The Place and *Time.*

The first groweth naturally in *Germany*, in divers places, and as *Cordus* saith, he observed two sorts, one growing neere the River of *Rhine* with a finer leafe, and firmer wood, and a little pith, and another about the *Danubius* or *Danow*, with broader leaves, and not so firme wood? The second is declared in the description: The third groweth not onely in *Narbone*, and about *Mompelier*, but in *Spaine* in divers places, as *Clusius* setteth it downe: the last in *Arabia*, *Egypt*, and the places neere thereabouts, they flower about the end of *May*, or in *June*, and the seed is ripe and blowne away in the biginning of *September*.

The Names.

It is called in Greeke μυρίκη in Latine also *Myrica*, and *Tamarix*, but of divers *Tamariscus*, and by *Pliny Bria sylvestris* in *Achaia* as *Lugdunensis* saith. The first is called *Tamariscus*, and *Tamarix humilis* by *Cordus* and others, and

and *Tamariſcus Germanica* by *Lobel*, all others call it *Myrica* or *Tamorix ſylveſtris* or *altera*. The ſecond hath no other name, but what I have given it. The third is called *Tamariſcus* or *Tamarix Narbonenſis* by *Lobel*, *Lugdunenſis*, and others, and *Myrica*, and *Tamariſcus ſylveſtris* by *Cluſius* and *Alpinus*, and *Tamarix Gallica aut Hiſpanica* by *Cluſius* alſo: The laſt is taken to be the *Myrica*, and *Tamarix ſativa* of *Dioſcorides*, by *Cluſius*, *Cordus* and others, by *Bellonius Tamarix gallis auuſt*. The *Arabians* call it *Chermaſel*, and the former ſort *Tarfa* or *Curfa*, the *Italians Tamarigio*, the *Spaniards Taray*, and *Tamargueira*, the *French Tamaris*, the *Germanes Tamariſchen baum oderholtz*, the *Dutch Tamarſchen*, and we in *Engliſh* the Tamariske tree.

The Vertues.

Tamariske as *Galen* ſaith, is of a clenſing and cutting quality, without any manifeſt drying, yet it hath a little therein, but the fruite and barke are much more drying, and is very powerfull againſt the hardneſſe of the ſpleene, if the roote or leaves or young branches be boyled in Wine or vinegar, and drunke and applyed outwardly to the place alſo, the leaves boyled in Wine and drunk, is good to ſtay the bleeding of the hemorrhoidall veines, the ſpitting of blood, and womens too abounding courſes, and helpeth the jaundiſe, and the chollick, and the bitings of the Spider *Phalangium*, the Viper and all other venemous Serpents, except the Aſpe. The barke is as effectuall, or rather more to all the purpoſes aforeſaid, and both it and the leaves boyled in Wine, and the mouth and teeth often waſhed therewith, helpeth the tooth ache, being dropped into the eares eaſeth the paines, and is good for the rednes & watering of the eyes: the ſaid decoction with ſome honey put thereto is good to ſtay gangrenes, and fretting ulcers, the ſaid decoction is alſo good to waſh thoſe that are ſubject to lice and nits. The wood is held ſo powerfull to waſte and conſume the hardneſſe of the ſpleene, that (although it is likely to be fabulous that is ſaid thereof) if Swine drinke, or eare their wash out of the troughes made thereof, it will waſte their ſpleene ſo much, as that they will be found quite without after a while, but it ſheweth that is very effectuall to conſume the ſpleene, and therefore to drinke out of cannes or cups made thereof, is very good for ſpleneticke perſons. The aſhes of the wood are uſed for all the aforeſaid effects, and beſides doth quickely helpe the bliſters raiſed by burnings or ſcaldings of fire or water. *Alpinus* ſaith and *Veſlingius* affirmeth it, that the *Egyptians* doe with as good ſucceſſe uſe the wood hereof to cure the *French* diſeaſe, as others doe with *Lignum Vitæ*, or *Guajacum*, and give it alſo to ſuch as are poſſeſt with lepry, ſcabbe, puſtles, ulcers, or the like and is availeable alſo to helpe the dropſie, ariſing from the hardneſſe and obſtruction of the ſpleene as alſo Melancholly, and the blacke jaundiſe that ariſeth thereof.

CHAP. LIX.

Erica. Heathe.

HEre are a great many ſorts of Heathes, and therefore to avoid confuſion I muſt devide them into foure Ranckes or Orders the firſt of thoſe whoſe leaves are like Tamariske, the ſecond like unto the Heathe-low Pine or *Coris*: the third is of thoſe that lye or leane downe to the ground, and the laſt of thoſe that beare berries.

1. *Erica vulgaris.* Common Heath.

2. *Erica vulgaris hirſutior.* Common rough Heath.

1. *Erica vulgaris.* Common Heathe.

The Heath that groweth moſt frequent in our Land, is a low ſhrubby plant, little above halfe a yard or two foote high, with rough woodby browniſh ſtalkes and ſundry branches, plentifully ſtored with ſmall ſhort greene leaves like to thoſe of Tamariske, foure uſually ſet together, from the middle to the ends of the branches, ſtand ſmall bottle like bright purpliſh flowers at ſeverall diſtances about the ſtalkes, and ending in foure corners, in which grow ſmall ſeede when they are paſt: the roote ſpreadeth deepe, ſometimes this is found with white flowers, but very ſeldome. *Flore albo*

2. *Erica vulgaris hirſutior.* Common rough Heath.

This other Heath groweth like the former in all things, but ſomewhat higher, the leaves whereof are alike alſo, but more rough, and of a hoary greene almoſt white: the flowers alſo are like, but ſomewhat paler, and herein conſiſteth the chiefeſt difference: the rootes of both grow downe, and are ſtrongly faſtned in the earth: the ſeed is like, and ſo is the roote.

3. *Erica Græca Phana dicta.* The Greekiſh common Heath.

Bellonius in his firſt Booke of Obſervations, and the 53. Chapter, that giveth us the knowledge of this Heath, ſaith, that meeting certaine boyes that had gathered bundles of Heath about *Syderocapſa* in *Macedonia* to burne, which they called *Phana*, was deſirous to know the difference betweene it and common Heath, and by them he learned this, as one eſpeciall note of difference, that it is eaſily pulled up by the rootes, without any inſtrument to digge the ground, when as the other common ſort cannot be gotten out without a ſpade to digge it.

The Place and *Time.*

The firſt groweth throughout the Land in waſte grounds that are called Heathes, becauſe this kinde of plant groweth moſt plentifully thereon: the ſecond groweth on *Windſor* Heath, where *Cluſius* ſaith he found it, and the laſt in many places of *Greece*, the firſt and ſecond are found ſometimes twiſe flowring in the yeare uſually; in *July* and *Auguſt*, and ſometimes in the Spring alſo.

The Names.

The generall name for Heathe in Greeke is ἐρείκη, but *Tetralix* by the *Athenians* as *Plinie* ſaith, in Latine *Erica*, and of ſome *Myrica*, miſtaking it; yet by *Varro Siſara*, but that particular ſort here ſhewed you in the third place is called *Phana* now adayes by the Greekes. *Marcellus* was in a very great errour, that made Heath a kinde of Broome, becauſe it ſerveth to the ſame uſe, that is, to ſweepe houſes. The firſt is by all called *Erica vulgaris*, and *Erica Myricæ folio* by *Lobel* and *Cluſius* who alſo ſo calleth the ſecond, which *Bauhinus* ſaith, ſome tooke to be the *Selago Plinij*. The laſt is ſufficiently expreſſed in the deſcription, and here before. The *Italians* call it *Erico*, the *Spaniards* *Queiro*, the *French* *Bruiere*, the *Germanes* and the *Dutch* *Heyden*, and we Heath.

CHAP. LX.

1. *Erica Coris folio maxima alba.*
The great white flowred Heathe.

THis Heath groweth the greateſt of any, even as tall as a man, and yet ſometimes much lower, with wooddy browne ſtalkes and branches, the leaves being ſmall round and ſhort, ſomewhat like thoſe of *Coris*, ſet in a *quadripartite* forme, or croſſe faſhion, the flowers likewiſe grow foure together at a ſpace, from the middle of the branches upwards, forming a very long ſpike of a foote long, and are like ſmall long and hollow white bottles ſomewhat ſweete, the ſeede and rootes are like the former kindes.

2. *Erica Coris folia maxima purpuraſcens.*
The great purple flowred Heath.

This differeth from the former in nothing, but in having ſlenderer ſtalkes, yet as high, and in th. flowers, which are long and hollow like them, but of a purpliſh colour.

Another like hereunto *Matthiolus* ſetteth forth with flowers onely at the toppes of the branches.

3. *Erica major floribus ex herbaceo purpureis.*
Greene Heath with purpliſh greene flowers.

This likewiſe differeth little from the laſt, but onely that it is lower and more largely ſpread, and hath darker green leaves, foure ſet together all along the branches, and flowers likewiſe up to the toppes in forme like them, but of a whitiſh greene purple colour being fully growne.

4. *Erica ſcoparia.* Bruſh Heath.

The Bruſh Heath groweth cloſe and round, with ſundry ſlender branches, and ſmall greene leaves on them, which quickely fall away from the ſtalkes being a little dry, and the flowers two together for the moſt part, ſmaller then the former, and of an herby greene colour, but hollow as the other: beſides theſe, it likewiſe ſometimes beareth ſmall ſcaly heads of leaves, like unto thoſe of the common hard Time.

2. *Erica Coris folia maxime purpuraſcens.*
The great purple flowred Heath.

Altera.

5. *Erica*

3. *Erica major floribus ex herbaceo purpureis.*
Great Heath with purplish greene flowers.

4. *Erica Scoparia.*
Brush Heath.

5 *Erica cum Polygalæ folio Serratum, rubens.*
Heath.

6. *Erica Scoparia altera.*
Another Brush Heath.

7. *Erica Coris folio quinta Cluſij.*
Cluſius his fifth Heath with triple branches and leaves.

8. *Erica virgata ſive ſexta Cluſij.*
Small upright Heath without branches.

5. *Erica pumila Belgarum Lobelij ſcoparia noſtras.*
The low *Dutch* or our Broome Heath.

This Heath groweth low and ſhort, hard and brittle, with blackiſh ſtalkes and browniſh branches, and ſmall greene leaves like thoſe of Tyme ſet on them, ſomewhat hairy, but foure together as in the reſt, the flowers grow five or ſixe together at the toppes of the branches, hollow like the reſt, and of a pale purpliſh colour.

6. *Erica ſcoparia altera.*
Another Broome Heath.

This other differeth not much from the laſt, but in bearing three leaves at a ſpace, ſomewhat broader then the other, green above and gray underneath, and a little hairy withall: the flowers likewiſe are many, and ſtand three together, at the toppes by equall diſtances, turning all one way, being ſomewhat larger and greater bellyed, but of a deeper red colour then the laſt.

7. *Erica Coris folio quinta Cluſij.*
Cluſius his fifth Heath, with triple branches and leaves.

This triple Heath groweth low, and with ſlender branches, three uſually ſet at a joynt, and three ſmall thinne leaves likewiſe ſet by ſpaces thereon, in an even order or manner, the flowers grow from the middle to the top, ſomewhat large, many together at the joynts, upon longer footeſtalkes, and are of a dull or dead purpliſh colour.

8. *Erica virgata ſive ſexta Cluſij.*
Small upright Heath without branches.

This Heath hath ſundry hard and upright ſtalkes riſing from the roote, ſcarſe a cubit high, being all ſingle, without any branch ſpreading from them, and covered with an aſh-coloured barke, at the ſeverall joynts whereof come forth divers ſmall darke greene leaves buſhing together, and towards the tops ſundry hollow flowers, like the reſt ſtanding together by ſpaces, of a moſt bright deepe crimſon colour hanging downe,

9. *Erica ſimilis peregrina planta Lobelij.*
Lobel his ſtrange Heath.

upon

upon long footestalkes: you must understand that all these sorts beare small seede, although it is not mentioned to every one.

9. *Erica similis peregrina planta Lobelij.* *Lobels* strange Heath.

This strange plant (which *Lobel* could not tell what to make of, finding it growing in a pot, in *Mounsieur de Brancion* his Garden, yet would joyne it in the end of his Heathes, with this title as one of them, is a very strange Heath indeed, when as he made another plant that was very like it, to be a kinde of *Sedum minimum vermiculatum*, as in the same page, and the next line unto this, he himselfe doth set it downe. yet calling it *Erica peregrina altera*, being so neere one unto another that I thinke them *congeneres*) groweth shrubby, that is, with wooddy stalkes and branches, like other Heathes, with many small long narrow leaves upon them, and purplish flowers at the toppes, consisting of foure small leaves apeece, as neere as my memory will serve me, saith *Lobel*.

The Place and Time.

Clusius saith, that he found the first in sundry parts of *Portugall*, not farre from *Lisbone*: the second in the same places, but more plentifully, and in the Country of *Narbone* as *Lobel* saith. The third also about *Lisbone*, and the fourth both in *Spaine*, *Portugall* and *Aquitaine*, and *Narbone* also almost every where, it flowreth there twise every yeare, both in the Spring and Fall: The fifth *Clusius* saith he found, both in *Brabant* and *Gelderland*, and also in old *Castile* in *Spaine*, and *Lobel* saith in *Flanders*, and *Brabant*, but he might as well have said, on *Hampsteed Heathe*, and divers other Heathes in *England*: The xth in *Portugall* also, and in our Land likewise. The seventh by *Lisbone* also. The eighth was seene by *Clusius* as well in *England* about *Windsor*, in flower in *September*, as in old *Castile*, and *France*. The last was not knowne to *Lobel* from whence it came to him that had it, neither can I say more of it: They flower most of them in *July* and *August*, and yet some continue in flower longer, and some beginne sooner.

The Names.

The first, second, third, and fourth here, are of the same numbers with *Clusius* in his history of Plants, and *Lobel* calleth the second *Inniperifolia densè frutticans Narbonensis*. The fifth is the thirteenth *Erica Coris folio* with *Clusius*, & with *Lobel Erica pumila Belgarum*, and the fifth *Erica* with *Dodonæus*. The sixth is *Clusius* his twelfth *Erica Coris folio*, which *Lobel* calleth *Erica Inniperifolia altera*. The seventh is *Clusius* his fifth *Erica coris folio*, which *Bauhinus* nameth *Erica ternis per intervalla ramulis*. The eighth is *Clusius* his sixth *Erica coris folio*, which *Lobel* calleth *Erica pumila caliculata unedonis flore*. The last is entituled by *Lobel* as I said, *Erica peregrina Brancionis*.

CHAP. LXI.

1. *Erica procumbens sive supina pallide purpurea.* Pale purple creeping Heath.

THis leaning Heath groweth up with many round browne stalkes, of a foote long or more, leaning downe to the ground, and sometimes taking roote againe as they lye, about whom are set many long small leaves foure set together, and sometime five at a place, the flowers are of a pale purple colour, standing at the toppes of the branches like unto the other of this kinde, the seed that followeth in this is in most of the other, is small and blackish, the roote is hard and wooddy.

2. *Erica supina herbacea.* The greene flowred Heath.

This Heath hath low creeping stalkes, scarse a foote high, branched forth, and foure leaves at every place, set a crosse thereon, the flowers come forth among the leaves, towards the tops, being small and hollow, with foure ends like the rest, but of an herby or greene colour: the seede is like the other.

3. *Erica supina carnea.* Blush coloured leaning Heath.

This low Heath groweth not higher then the last, but much more beautifull in that, although the stalkes be blackish and slender, leaning to and lying on the ground, and the leaves stand by three at every space all along the branches: yet the flowers that grow at the ends of them, are of a fine flesh colour, hollow like the rest, and ending in foure points with eight blackish threds within them, and a purplish pointell in the middle; this hath also small blackish seede, this is often found with leafy greene heads like those of Time.

4. *Erica supina maritima ultima Anglica.* Our English low Sea Heath.

4. *Erica supina maritima Anglica.* Our *English* Sea low Heath.

This fine small Heath groweth low, but thicke set with stalkes and branches, and thereon very small blewish greene leaves up to the toppes where the flowers stand many together as in others, of an excellent purple colour, continuing long in flower and colour.

The

The Place and Time.

The first *Clusius* found in *Styria* and *Austria* upon the hills there, and so likewise the second, and the third in *Hungary*, and flower at the time with the rest: The last was found by *Lobel*, about *Porsmouth* in our owne Land.

The Names.

The first, second, and third, is the sevënth, eighth, and ninth *Erica Coris folio* of *Clusius*, the last hath not beene mentioned by any before now, and by *Lobel* termed *angustifolia maritima Anglo britanica.*

CHAP. LXII.

Erica baccifera fructu albo. White berryed Heathe.

THe white berryed Heath riseth up with stalkes a cubit high distributed into branches, and both covered with a blacker barke then any of the rest, the leaves likewise that are set in a triple order at every p ace, are of a blacker greene colour, and of a little heating as well as binding taste: it hath sundry small brave shining or transparent white berries like almost unto darke pearles, at the toppes of the branches full of an acide juyce, and three hard graines or seede within them, what flowers it bore hath not beene as yet observed.

2. *Erica baccifera nigra.* Blacke berryed Heath.

The branches of this Heathe, spread farre about upon the ground, and as they lye shoote forth rootes againe, taking up after a while, a great deale of roome, which a number of triple leaves doe compasse, and sometimes foure at every space, being thicker, somewhat like unto the former, at the first of a drying taste, and after somewhat sharpe and biting upon the tongue: the flowers stand at the joynts with the leaves, towards the toppes, consisting of three leaves a peece, of a whitish greene colour, with purplish threds within them, which turne into small blacke berries, like unto Iuniper berries, with a darke purplish juyce within them, and many triangular graines or seed within them likewise.

The Place and Time.

Clusius saith he onely found the first not farre from *Lisbone* in *Portugall*, and the other on the Hills of *Austria* and *Styria*, and we may say in *England* and *Ireland* also in many places, and flower at the same time with the rest, or rather somewhat later.

The Names.

The first is called *Erica baccifera* by *Lobel*, and *Erica baccifera tenuifolia* by *Tabermontanus* and *Gerard*, and is the tenth *Erica coris folio* of *Clusius*, *Amatus Lusitanus* tooke it to be the *Acacalis* of *Dioscorides*, which the *Por-*

1. *Erica baccifera fructu albo.*
White berryed Heath.

2. *Erica baccifera nigra.*
Blacke berryed Heath.

tingale

tingals call *Tamarinhera*, and the fruite *Tamarinhas*. The second is the *Erica baccifera* of *Matthiolus*, which *Lobel*, *Lugdunenſis*, and *Thalius* call *Erica baccifera Matthioli*, and is the eleventh *Erica coris folio* of *Cluſius*: but this is not the *Vaccinia paluſtria Dodonæi*, before ſet forth, which *Lugdunenſis* calleth *Erica baccifera Dodonæi*, nor the *Oxycoccum Cordi*, being all one.

The Vertues.

I have reſerved the declaration of the Vertues of all the former, unto this place, that I might ſhew you them altogether. Heath is ſomewhat drying, and a little bitter withall, except the berryed ſorts, as *Cluſius* hath related by the taſte of moſt of them. *Galen* ſaith it hath a digeſting quality, reſolving the malignity of humours, by tranſpiration or ſweating, which a decoction of the flowers being drunke, doth performe, and thereby giveth much eaſe to the paines within the body, and expelleth the wormes therein alſo: the leaves and flowers made into a decoction is good againſt the ſting or bitings of Serpents, and other venemous creatures, and the ſame being drunke warme ſaith *Matthiolus*, for thirty dayes together, morning and evening, doth abſolutely breake the ſtone and drive it forth: the ſame alſo, or the deſtilled water of the whole plant, being drunke eaſeth the chollicke: the ſaid water or the juyce of the herbe dropped into the eyes helpeth the weakeneſſe of the ſight: *Cluſius* ſaith that *Rondeletius* at *Mompelier* uſed the oyle made of the flowers of Heath with good ſucceſſe againſt the Wolfe in the face or any other foule or fretting and eating canker ſpreading over the whole face: the ſame alſo doth diſſolve tumours: a bathe made by decoction of the herbe and flowers is good for them to ſit in, that are troubled with the ſtone, or with the gout, for it giveth much eaſe to them both: the white berryes of the Heath ſaith *Cluſius* are brought to the markets in *Spaine*, and there ſold to give to thoſe that have hot agues, to coole the heate and quench their thirſt; and beſides are much deſired ſaith hee, of women and children, to pleaſe their pallate: the hony that the Bees take from the flowers of Heath is called *mel improbum*, but we have not found any ill quality therein in our Land: onely it will be higher coloured then in thoſe places where no Heath groweth.

CHAP. LXIII.

Agrifolium ſive Aquifolium. The Holly buſh or tree.

SOme have thought that there are divers ſorts of Holly, ſome trees, ſome ſhrubs, ſome with prickly leaves, and ſome with ſmooth, but the truth is, it is but of one ſort, for although it hath beene ſeene in divers places to grow to be a great tree, as *Geſner* in *hortis* reporteth, of divers, and of one at *Curia* thirty foote high, whoſe leaves were ſmooth and not prickly, yet no doubt but it roſe from a young ſhoote that was prickely at the firſt, for while it is ſuffered to ſhoote forth ſundry roddes from the roote, or before any of them groweth to be great, the leaves are prickely, but growing old as the *Ilex* doth, it looſeth the prickles and becommeth ſmooth, and onely prickely at the end, and ſometimes not. It is with us moſt uſually a buſh, and with many ſhootes from the roote growing ſlowly, unleſſe the ground be not gravelly, where it moſt frequently is found, but more mellow and gentle; the outer barke whereof is of a ſad greene colour, but it hath alſo another inward, which is whiter: the leaves are ſet on the ſtalkes and branches on ſhort footeſtalkes, being ſomewhat broad, hard, thicke and long, ſmooth ſhining, and of a very freſh yellowiſh greene colour, cut round about the edges, into round notches or dents, and every point of them very ſharpe and prickely: the flowers grow cloſe to the ſtalkes, at the foote of the leaves many comming forth together round about them, and conſiſt of foure white leaves with foure threds in the midole ſtanding about a greene round head, with groweth to be a ſmall red berry when it is ripe, like unto a Hawthorne berry, but with a little Crowne at the toppe which parteth into foure ſmall triangular ſeede, with hard ſhels, and a ſmall ſweete kernell within them, abiding on all the Winter, almoſt in his greateſt beauty: the roote groweth deepe, the wood is firme and hardly ſinking in water, and of a whitiſh colour.

2. *Aquifolium undique echinatum.* Holly with leaves wholly prickely.

This differeth not from the ordinary ſort, either in body, barke, fruite, roote, or uſe, onely in the leafe, which is no leſſe armed with ſharpe prickles, all upon as about the edges thereof.

The Place and *Time.*

Holly groweth in waſte and untilled grounds, in divers Countries throughout the whole Land, and as I ſaid ſeldome groweth with us to be a tree of any bigneſſe, it flowreth in *June*, and the berryes grow ripe, not untill the end of *October*, and then abide almoſt all the Winter long, being freſheſt at *Chriſtmas*, the leaves doe alwayes abide greene.

The Names.

Theophraſtus calleth it in Greeke ἀγρία, which *Gaza* rendereth *Aquifolia*, following *Pliny* therein, and yet he hath an *Aquifolia Ilex*, which is the *Ilex coccigera* declared before, by which name he would intimate that there is an *Ilex*, that hath dented prickly leaves, as the *Aquifolium* hath, and not that the *Aquifolium* is any kinde of *Ilex*, which beareth Acornes, and the rather in that the *Aquifolium* doth not endure ſuch hot ſituations as that *Ilex* doth: ſome doe call it *Agrifolium*, as well as *Aquifolium*, *Lacuna* tooke it to be *Dioſcorides* his ſecond *Paliurus*, and *Guilandinus* from *Pliny*, the *Cratægus* of *Theophraſtus*, *Dodonæus* ſaith that ſome called it *Ruſcum ſylveſtris*, *Cæſalpinus* doubteth whether it may not be the *Hedera rigens* of *Pliny*, which he ſaith, *ſtat ſine adminiculo*, and therefore, *ſola omnium generum ob id vocata ciſſos*, none of theſe Authours ſhewing any prickles in the leaves of thoſe plants they ſet forth. The *Italians* call it *Aquifoglio*, the *Spaniards Azebos*, the *French Houx*, and *Houſſon*, the *Germanes Walddiſtell*, and of ſome *Stechender Palmen*, as *Geſner* in *hortis* ſaith, which is *Palma aculeata*, without all reaſon, the *Dutch Hulſt*, and we Holly, or Holme and Hulver.

The Vertues.

The berries are hot and dry, and of thinne parts, helping to breake winde ſaith *Dodonæus*, and therefore good to helpe the chollicke, for ſaith he, I have it from them who have made tryall of them, that tenne or twelve of the

2. *Agrifolium ſive Aquifolium*
The Holly buſh or tree.

2. *Aquifolium ſolio leui & aculeato toto.*
Holly with ſmooth leaves, and one all over prickely.

the berryes being taken doe purge by ſtoole, groſſe clammy and flegmaticke humours: *Gerard* appropriateth theſe words to himſelfe, as if he had had the relation, and yet he ſaith within a few lines after, that Holly beaten to pouther, and drunke doth ſtay fluxes and diſcenteryes, which are quite contrary one to another, upon a ſuddaine apprehenſion, but upon better conſideration they may both ſtand for good that the freſh berries, by reaſon of their moiſt ſlipperineſſe may move the belly downewards, and the berries being dryed, and thereby having loſt their moiſture and ſlipperineſſe, doe then binde the belly as we have knowne by many experiences: but the barke of the tree, or the branches, is held to be much more effectuall to binde then the berries: *Matthiolus* ſaith that a decoction of the rootes of Holly (but ſaith he the barke of the roote is more powerfull) fomented on the places that have beene put out of joynt, doth helpe them much, both to mollifie and diſcuſſe the hardneſſe and tumours, the places gather thereon, and helpeth alſo to conſolidate the broken bones: ſome uſe to tie the branches with leaves upon their Bacon, and Martinmas Beefe, to keepe Rats and Mice from them by their prickles: the branches with berries, are uſed at *Chriſt tide* to decke up our houſes withall, but that they ſhould defend the houſe from lightening, and keepe themſelves from witchcraft, is a ſuperſtition of the *Gentiles*, learned from *Pliny* ſaith *Matthiolus*: with the flowers of Holly ſaith *Pliny* from *Pithagores*, water is made ice: and againe, a ſtaffe of the tree throwne at any beaſt, although it fall ſhort by his defect, that threw it, will flye to him, as he lyeth ſtill, by the ſpeciall property of the tree: This I here relate, that you may underſtand the fond and vaine conceits of thoſe times, which I would to God we were not even in theſe dayes tainted withall. The Birdlime made of the rootes of Holly, is as good as that made of Miſſeltoe, whereof neither is to be admitted into inward Phyſicke without certaine death or danger.

CHAP. LXIV.

Laurus. The Bay tree.

VNder the name of *Laurus* is deſcribed ſundry ſorts of plants by the ancients, as *Laurus Alexandrina*, *Chamedaphne*, *Daphnoides*, and *Laurus Tinus*, and *Taxa*, and others, whereof I meane not to entreate in this place, having ſpoken of them already in others, but of thoſe trees that are properly called Bay trees, which are two, onely knowne to us in *Europe*, the one with broader, the other with a leſſer leafe (and yet *Bellonius* ſaith, he obſerved five ſorts in Mount *Athos* and *Greece*) where unto might be adjoyned the wilde Bay, but that I have ſhewed you the ſorts thereof in another place, but unto them I will adde another ſort of rare Indian Bay tree, lately knowne unto us.

1, 2. *Laurus latifolia major & minor.* The greater and the leſſer Bay tree.

3. *Laurus Americana exhorto Farneſiano cu jus cort ex Caſſiæ Lignea multum aſſimilatur.* A ſtrange Indian Bay tree, or *Caſſia Lignea* of the Weſt Indies.

1. *Laurus major ſive latifolia,* The greater Bay tree.

This Bay groweth with us in many places, very high, ſpreading armes and branches reaſonable well, cover-ed with a darke greeniſh barke, the leaves are ſomewhat broad and long, hard, full of veines, of a darke greene colour, pointed at the ends, and ſmelling ſomewhat ſweete, but of a bitter taſte, and alwayes abiding on the trees, the flowers grow many together, and of a whitiſh greene colour, after which come ſomewhat long and round berries, with a tough blacke skinne or covering, ſomewhat wrinckled, with a hard firme kernell within, parting into two parts, the roote ſpreadeth under the ground, and groweth deepe alſo: the wood is firme, ſmooth, and white.

2. *Laurus minor.* The leſſer Bay tree.

The leſſer Bay tree groweth not ſo high, and doth runne more into ſuckers or ſhootes, whereon grow ſmaller thinner, and longer leaves then of the former, yet ſmelling well alſo, the reſt of the parts doe not vary much, but that the berryes be ſmaller and rounder.

3. *Laurus Americana cujus cortex Caſſiæ lignea multum aſſimilatur.*
The ſtrange Indian Bay tree, or *Caſſia Lignea* of the Weſt Indies.

I muſt needs adjoyne this ſtrange Indian Bay tree, both for the rarity and excellency thereof, which I take out of *Tobias Aldinus* his deſcription of ſome plants that grew in Cardinall *Farneſius* his Garden at *Rome*, and grew from the berries were brought from the Weſt Indies, in that Garden of the Cardinall 1620. which were blacke rugged, like Bay berries, and ſomewhat long like Ollives, pointed at the end, and divers growing together in a bunch, each upon a ſhort footeſtalke, it ſhortly grew into a great height and bigneſſe, the leaves were very like unto Bay leaves, or rather in a meane betweene the great Kings Bay (which I take to be that we call *Laurocera-ſus*) and the common Bay or the Citron tree, which being chewed, at the firſt are ſomewhat bitter, but after with a ſweetneſſe have ſome maccilaginoüſneſſe or clammyneſſe in them, yet ſmelling like the common Bay, whoſe footeſtalke is thicker then of them, and the branches ſmaller and finer: but ſaith it is wonderfull to feele ſo much viſcide and tough clammineſſe in them, which made a doubt with ſome learned Herbariſts, whether it were not the tree of Cinamon, or of *Caſſia* or Canell, and that not by any light conjecture, for *Garzias ab orta* ſaith the leaves of the Canell tree are of the colour of Bay leaves, but neere the forme of the Citron tree leaves, and all Authours writing of the trees of Cinamon or Canell, ſay the leaves are like Bay leaves: the fruite alſo by *Garzias* of the Canell, is blacke and round, of the bigneſſe of an Haſell nut and like an Ollive. *Gomara, Carate,* and *Cieça* ſay that the fruite groweth in cluſters or bunches, *Aceſta* that the fruite is blacke and ſhining, when it is ripe, the maccilaginous taſte alſo in this plant, ſeemeth to be in that ſort of Canell is thought with us to be the true *Caſſia lignea*, yea the beſt *Caſſia* with *Dioſcorides* is called *Daphnitis* which is a word derived from *Daphne* which is a Bay: but ſaith he, I will ſhew you my opinion, that we have no true Cinamon, although I have read of many that affirme our Canell to be the true Cinamon of the Auncients, yet I have ſaith he, many reaſons a-

gainſt

gainſt it, which for brevity I here omit, hoping to declare them in another place.

The Place and *Time.*

The Bay groweth wilde naturally in divers places of *Narbone* in *France*, *Spaine*, and *Italy* and in other warme Countryes where it groweth very great, eſpecially neere the Sea, but is wholly planted with us, or raiſed from ſowing the berries: it flowreth in *May*, the fruite is ſcarſe thorough ripe either in *October*, or *November*.

The Names.

It is called Δάφνη in Greeke, *quaſi* διαφαύη *quod uſta valde ſonet*, for nothing doth more crackle or make a noiſe in the fire then it: in Latine *Laurus*: much Gentiliſme might be inſerted here of *Daphne*, the Daughter of *Ladon*, whom *Apollo* overtooke flying from him, and by the implored aide of her mother earth was transformed into a Bay, from whence taking a branch, he in honour of her, crowned himſelfe: but under this rugged ſhell was hid a ſmoother kernell: for the Bay was a token of prophecy, and by *Apollo* is ſignified wiſdome: that is, that wiſdome doth foreſee events, when the paſſions be overruled: as alſo that they wore a Garland of Bayes to be kept ſafe from lightening and thunder: that wiſedome knoweth how to avoide the judgements of God, when fooliſhneſſe is liable to them, and muſt undergoe them. The *Arabians* call it *Gaur* or *Gar*, the *Italians Lauro*, the *Spaniards Laurerro*, the *French Lanrier*, the *Germanes Lorbeenbaum*, the *Dutch Laurusboom*, and we the Bay tree: the berryes are called in Greeke δαφνίδες, in Latine *Lauri baccæ*.

The Vertues.

Galen ſaith that the Bay leaves or barke doe dry and heale very much, and the berries more then the leaves: the barke of the roote is leſſe ſharpe and hot, but more bitter, and hath ſome aſtriction withall, whereby it is effectuall to breake the ſtone, and is good to open the obſtructions of the Liver, Spleene, and other inward parts, as the dropſie and jaundiſe: the berryes are very effectuall againſt all venome, and poyſon of venemous creatures, and the ſtings of Waſpes, and Bees, as alſo againſt the peſtilence, or other infectious diſeaſes, and therefore is put into ſundry Treakles for that purpoſe: they likewiſe procure womens courſes, and if ſeven of the berries be taken by a woman in ſore travell of childbirth, it will cauſe a ſpeedy delivery, and expell the after birth alſo, and therefore women with child that have not gone out their time, muſt take heed of taking any, leſt they procure an aborſement, or delivery before their time: they wonderfully helpe all cold and rheumaticke diſtillations, from the braine to the eyes, lungs, or other parts, and being made into an electuary with honey, they helpe the conſumption, old coughes, ſhortneſſe of breath, and thin rheumes: they likewiſe helpe the Meagrome, and mightily expell winde, and provoke urine, and helpe the Ventoſities of the mother, and kill the wormes: the leaves worke alſo the like effects, and boyled in fiſh broth, give a fine relliſh, both to meate and broth, and helpeth to warme the ſtomacke, and to cauſe digeſtion, without feare of caſting, which taken by themſelves they oftentimes provoke: a bathe of the decoction of the leaves and berries, is ſingular good both for women to ſit in that are troubled with the mother, or the diſeaſes thereof, or with the ſtoppings of their courſes, or for the diſeaſes of the bladder, paines in the bowells by winde, and ſtoppings of urine: a decoction likewiſe of equall parts of Bay berries, Cuminſeede, Hyſſope, Origanum, and Euphorbium with ſome hony, and the head bathed therewith, doth wonderfully helpe deſtillations and rheumes, and ſetleth the pallate of the mouth into its place: the oyle which is made of the berries, is very comfortable in all cold griefes of the joynts, nerves, arteries, ſtomacke, belly or wombe, and helpeth palſies, convulſions, crampes, aches, tremblings, and numneſſe in any part, wearineſſe alſo, and paines that come by ſore travelling in wet weather, or foule wayes: all griefes and paines likewiſe proceeding from winde, either in the head, ſtomacke, backe, belly or wombe, by annoynting the parts affected therewith, and by putting ſome of the oyle, or boyling the berries in the decoctions for gliſters, doth breake wind and eaſe the torments of the belly by the winde chollike wonderfully: it helpeth alſo the paines in the eares, either ſome of the oyle dropped thereinto, or a decoction of the berries being made to receive the warme fumes thereof into the eares by a funnell: the ſaid oyle taketh away the markes of the skinne and fleſh, by bruiſes, falls, &c. and diſſolveth the congealed blood in them: it alſo helpeth the itch, ſcabs, and wheales in the skinne.

CHAP. LXV.

Arbutus & Adrachne. The Strawberry trees.

THeſe two trees doe both goe under one *Engliſh* name of the Strawberry tree, becauſe they are ſo like one unto another, both in their growth, leafe, and fruite, that one not very well acquainted with them, may ſoone miſtake one for another, and therefore I have thought good to put them both into one Chapter.

1. *Arbutus.* The Strawberry tree with dented leaves.

This Strawberry tree (in ſome places, as in Mount *Athos*, as *Bellonius* reporteth, groweth to be a tree of very great heighth and bigneſſe) in moſt other places it groweth but low, or rather like unto a ſhrub tree then of any bigneſſe, having a rugged barke on the body, and ſmooth or red on the young branches, and having many ſuckers riſing from the rootes, with faire freſh greene leaves, ſet without order thereon, very like unto Bay leaves, but thicker, ſhorter, and finely dented about the edges, and without any ſent, as the Bay leaves have, with a reddiſh middle rib in ſome places, but not uſually ſo with us, and abiding on the buſhes like the Bay: at the ends of the branches come forth long ſtalkes, with very fine white flowers ſet thicke together all the length of them whoſe brimmes are a little red or bluſh colour, formed like unto little bottles, or the flowers of Lilly convally, which being paſt, there riſe in their places, ſeverall round berryes, greene at the firſt, yellowiſh afterwards, and of an excellent reddiſh colour, and ſomewhat hoary withall being full ripe, like unto a Strawberry, but much greater in the naturall warme Countries, as great as a plumbe, but with us, and in *Ireland*, where they have beene found growing of their owne accord, no bigger then a Raſpis berrie, and neere unto the ſame, both forme and colour, that is, like a pallide clarret Wine, of an auſtere taſte, and having certaine ſmall ſeedes within them each of them covered with a thinne skinne,

1. *Arbutus.* The Strawberry tree with dented leaves. 2. *Adrachne.* The Strawberry tree with smooth leaves.

2. *Adrachné.* The Strawberry tree with smooth leaves.

This other Strawberry tree groweth low and never seene so high as the former; but so like thereunto that it is discerned from it onely by these markes; the barke of the tree and branches is not rough or rugged, but smooth and redder by much, both in young and old branches like unto Corrall, yet *Theophrastus* saith it hath a white barke, which it is like he meaneth of the under or new barke that commeth after the old falleth away in Summer, but the *Arbutus* doth not so: the leaves are so like unto Bay leaves, being also smooth and not dented on the edges that they are onely distinguished from them by the smell, these having no sent, and the berries hereof are of a darker red colour, and somewhat more sweete, the other being a little austere or harsh, and so tasting on the tongue in the eating.

The Place and Time.

Both these sorts grow in the warme Easterne Countryes abundantly as also in *Greece*, and the Isles of the *Mediterranean* Seas, especially in *Candy*, on the hills, and among the Rockes, but the first especially in *Italy*, *Spaine*, and some parts of *France*, and hath beene of late dayes found in the West part of *Ireland*, of a reasonable bigge size for a tree, but with smaller fruite: it flowreth not onely in *July*, in the warme Countries, but at other times of the yeare also, and the fruite scarse ripeneth in a whole yeare, for I have seene a fresh branch, that was brought me with fresh sprung flowers and ripe fruite thereon likewise, so that it is usually seene both with flowers and fruite at once. The *Adrachne* is every third yeare spoyled of the outer barke, and regaineth it quickely, and keepeth the same time with the other.

The Names.

The first is called in Greeke κόμαρος *Comarus*, and the fruite so also by some, or μεμακύλον *Memacylon*, as *Dioscorides*, *Galen*, and others say, in Latine *Arbutus & Unedo*, and by *Ovid Fraga montana*; some have thought that the *Arbutus* of *Dioscorides*, and *Theophrastus* were differing plants, because their descriptions were so divers, but by the judgement of the best they are both one, the other is called in Greeke ἀδράχνη, yet the most Greeke copies have ἀνδράχνη, but because *Adrachne*, is the herbe *Portulaca*, Purslaine, which some to distinguish would call this *Portulaca arbor*, but *Pliny* findeth the fault, and therefore calleth it *Adrachne* and *Portulaca arbor*, since which *Gaza* and others have followed him therein: but the *Grecians* generally now adayes, as well as those in *Candy*, call it *Adrachla*, as *Honorius Belius* saith: all our moderne Writers call them, by the same names, and no other then are here set downe, except *Guilandinus* in *Papyro*, who attributeth all these names to one plant *Omarum*, *Conarum*, *Arbutus & Unedo*. And it is observed that *Galen* saith in *Italy* among the vulgar, *Epimelis* was called by the name of *Unedo*, peradventure because the flowers of *Epimelis* are very like to those of *Arbutus* or *Unedo*, when as *Epimelis* is defined by himselfe to be another plant, differing both from *Arbutus*, *Unedo*, or any of *Dioscorides* sorts of *Mespilus*. The *Arabians* call the *Arbutus* *Hatiladib*, the *Italians* *Albatro*, the *Spaniards* *Madronho*, and *Madromeiro*, the *French* *Arbousier*, the *Dutch* as not knowne to them have no name that I can finde, and we call them

them both the Strawberry tree, but with the ſeverall diſtinctions that I give them in their titles: yet it hath come to us from *Ireland*, by the name of the Cane Apple, with as great judgement and reaſon as many other vulgar names are.

The Vertues.

Dioſcorides and *Galen* ſay of the *Arbutus* that it is troubleſome to the ſtomacke, and breedeth head ache, and therefore adviſeth thoſe that have any paine in the head to forbeare the eating of that fruite, *Amatus Luſitanus* firſt ſetteth it downe, that the deſtilled water of the flowers and leaves of the *Arbutus* (but *Matthiolus* addeth the *os de Corde cervi* to be mixed therewith in pouther) is a ſoveraigne remedy and helpe againſt the peſtilence, and all other venome to be given preſently upon the firſt complaining of the griefe, it is aſtringent or binding, and therefore may well ſerve againſt fluxes: the properties of the other are not declared.

CHAP. LXVI.

Morus. The Mulberry tree.

THere are two or three ſorts of Mulberries as I have elſewhere ſhewed, yet I muſt ſhew you them here alſo.

1. *Morus nigra vulgaris.* The common blacke Mulberry tree.

This groweth if it be ſuffered very great and tall, otherwiſe it will be led on Arbours, or as you will have it, the body being great, and both it and the greater armes covered with a thicke rugged barke, the younger boughes and branches being ſmoother, whereon are round broad leaves ſet, pointed at the end, dented about the edges, and ſometimes gaſhed in on the edges, reſembling a Vine leafe, the bloomings or flowers are ſhort downie catkins, after which follow the fruite made of many graines ſet together greene at the firſt, red afterwards, and ſomewhat harſhe or ſowre, but blacke when they are full ripe, full of a ſweetiſh juyce, that will dye the fingers and mouth of them that gather and eate them: wherein lye divers ſmall ſeed, the roote groweth not deepe, but ſpreadeth farre, being of a yellowiſh colour.

2. *Morus alba.* The white Mulberry.

The white Mulberry groweth not to that greatneſſe, but riſeth higher, more knotty and brittle, ſpreading reaſonable well, but not ſo thicke, the leaves are like the former, but not ſo thicke ſet on the branches, nor ſo hard in handling, of a paler greene, and ſomewhat longer, and more divided with longer ſtalkes: the fruite is ſmaller and cloſer ſet together, greene and ſomewhat harſh before they are ripe, but exceeding ſweete, almoſt ready to procure loathing, when they are thorough ripe, and whitiſh, with the like ſeede as is in the former: the roote likewiſe is yellow but paler.

1. *Morus nigra vulgaris.* The common blacke Mulberry tree. 2. *Morus alba.* The white Mulberry tree.

3. *Morus*

3. *Morus Virginiana.* The *Virginian* Mulberry.

The *Virginian* Mulberry groweth quickely with us to be a very great tree, ſpreading many armes and branches, whereon grow faire great leaves very like the laſt: the fruite or berry is longer and redder than the firſt when it is ripe, and very pleaſant alſo.

The Place and *Time.*

The two former ſorts are nourſed up as it were in Woods or great Orchards, in the Levant Countries to nouriſh their ſilke Wormes, where they keepe abundance, and may peradventure be naturall in ſome of thoſe places; they are plentifully alſo nourſed up in *Italy* for the ſame purpoſe: but the laſt as the name importeth came from *Virginia*, where it groweth hugely, with great ſtore of great leaves and ſmall ſtore of fruite, but in the ſeaſon with the other, which is in *July* and *Auguſt*, yet the leaves of them all appeare the laſt of all other trees.

The Names.

It is called in Greeke μορέα and συκάμινος & *Morea & Sycaminos*, in Latine *Morus*; ſome call the firſt *Morus rubra*, and others *nigra*, in our ſhoppes *Morus celſa quaſi excelſa*, as a diſtinction betweene it and the bramble *Rubus*, whoſe berryes are called alſo *Mora*; but *batis* is added to know it by, the white is called *Morus alba & candida* by all: *Bellonius* ſaith that the *French* doe falſely call it *Sycomorus*, but we ſhall ſhew you the true *Sycomorus* by and by. The *Arabians* call it *Tut* and *Thut*, the *Italians Moro*, the *Spaniards Moras del Moral*, the *French Meurier* and *Meure*, the *Germanes Maulberbaum* and *Maulbeer*, the *Dutch Mooerbeſcemboom*, and we in *Engliſh* Mulberry, and Mulberry tree.

The Vertues.

The Mulberry is of different parts, the ripe berryes being by reaſon of their ſweeteneſſe and ſlippery moiſture, opening the belly, and the unripe binding it, eſpecially when they are dryed, and are then good to ſtay fluxes and laskes, and the abundance of womens courſes: but the barke of the roote hath a ſtronger purging quality, and a bitterneſſe withall, whereby it is able to kill the broad wormes in the body of men or children: the leaves and young tender toppes have a middle or temperate faculty: the ripe berries if they be taken before meate, doe make paſſage for the reſt to follow, but if after meate, and paſſe not quickely away, they corrupt in the ſtomacke and draw the reſt on to putrefaction with them, otherwiſe they trouble little: the juyce, or the ſyrope made of the juyce of the berryes, helpeth all inflammations and ſores in the mouth or throate, and the *Uvula* or pallate when it is fallen downe: the juyce of the leaves is a remedy againſt the biting of the ſpider *Phalangium*, or any other Serpent, and for thoſe that have taken *Aconite*, the leaves beaten with Vinegar is good to lay on any place that is burnt with fire: the leaves of the Vine, of the earely Figge, and of the Mulberry, boyled in raine water is good to waſh the haire, to cleare and to give it a faire colour: a decoction made of the barke and leaves is good to waſh the mouth and teeth when they ake: if the roote be a little ſlit or cut and a ſmall hole made in the ground next thereunto, in the harveſt time it will give out a certaine juice, which being hardned; the next day is of good uſe to helpe the toothache, and to diſſolve knots, and purge the belly: the leaves of Mulberries are ſaid to ſtay bleeding in any place of the body, whether it be at the mouth or noſtrils, or the bleeding of the piles, or of a wound, being bound unto the places: a branch of the tree taken when the Moone is at the full, and bound to the wriſt of a womans arme whoſe courſes come downe too abundantly, doth ſtay them in a ſhort ſpace, the leaves laid to ſteepe in urine doe take away the haires from skins.

CHAP. LXVII.

Sycomorus. The true Sycomore or Mulberry Figge.

THere are two ſorts of this Sycomore tree, the one bearing fruite out of the body, and greater armes of the tree onely, the other upon ſtalkes without leaves.

1. *Sycomorus ſive Ficus Ægyptia.* The Sycomore of *Egipt.*

This Sycomore groweth to bea very great tree, bigger then the Mulberry tree, with great armes and branches, and thereon full of round ard ſomewhat long leaves pointed at the ends, and dented about the edges, very like the round leaves of the Mulberry tree, but harder and rougher like Figge leaves, this beareth ſmall figs or fruite, and no flower, and that differing from all other trees, for it thruſteth them forth from out of the very trunke or body it ſelfe onely, and the elder branches next to the body, and no where elſe, and are very like unto white or wilde Figges, and of the ſame bigneſſe, but much ſweeter, and without any kernels therein, the whole tree and every part aboundeth with milke, if the barke be but gently wounded, for if deepe it giveth no milke at all, which maketh it to beare three or foure times every yeare, new riſing out of the places where the old grew (but whereas *Theophraſtus* and *Dioſcorides* ſay, that the fruite ripeneth not, unleſſe they be ſcratched with iron ſcratchers, and that within foure daies after they will be ripe, the uſe in theſe dayes, where they grow is, that they doe aſcend the trees, and with ſmall knives, cut a ſmall peece from the head of every fig, while they are greene, and after the poorer ſort of people eate them. The wood hereof is ſollid, hard and blacke, and abiding freſh, and as if it were ſtill greene long after it is felled, neither will become dry, unleſſe it be kept under water, and therefore is fitteſt to make piles in Marſhes, or waters.

2. *Sycomorus altera ſeu Ficus Cypria.* Another Sycomore or Figge of *Cyprus.*

This other Sycomore groweth to be as great as a Plummetree, or white Poplar tree, whoſe armes and branches are ſtored with broad and ſomewhat round leaves, like unto the Elme (which made *Dioſcorides* ſay it was an Elme) but indeed very like unto the former: this alſo beareth ſuch like fruite like Figges but ſmaller, even no bigger then plummes which riſe both from the body, and the greater armes, but not immediately out of them, as in the former, but on certaine ſtalkes in branches, which riſe by themſelves, without any leaves with them, and are as ſweete as figges, and beare alſo foure times every yeare, but not unleſſe they be ſlit, that the milke in them may come forth.

The Place and *Time.*

The firſt groweth chiefly in *Egipt*, in *Syria* alſo, and *Arabia*, and other the places neere thereunto: the other in

in *Cyprus*, *Caria*, *Rhodes*, and other the places neere them: they have not beene brought into *Italy* that I can learne: their Time is expreſſed in their deſcriptions.

The Names.

The firſt is called in Greeke συκόμορος and συκάμινος alſo by ſome, but not rightly as *Dioſcorides* ſaith; in Latine alſo *Sycomorus*, and *Ficus Egyptia*, the *Egiptian* fig, and is the true Sycomore tree, and *Theophraſtus* calleth it *Morus Ægyptia*, ſo called as *Galen* ſaith, from the likeneſſe of the tree and the fruite unto the Mulberry, and the Figge. *Bellonius* ſaith the *Egiptians* now adayes call it *Ficus Pharaonis* in their language, and ſome *Giumets* as the *Arabians* doe, the other is called by *Theophraſtus Ficus Cypria in Creta*, *Matthiolus* calleth it *Sycomoro ſimilis*, *Cordus* on *Dioſcorides*, *Sycomorus in Cypro*, and *Lugdunenſis* from *Rauwolfius Ficus Egyptia Dioſcoridis*, *Sycomorus Græcorum*, and *Mumeitz* of the *Arabians*.

The Vertues.

The fruite of the Sycomore trees agree well in the belly, and maketh it ſoluble, but is troubleſome in the ſtomacke, by the overmuch moiſture, and giveth but little nouriſhment to the body: the milke that is taken from the tree, by wounding it gently, and afterwards dryed and made into Trochiſces, and kept in an earthen pot, hath a property to mollifie hard tumours, to ſoder or cloſe together the lippes of greene wounds, the fruite it ſelfe being laid plaiſterwiſe, worketh after the ſame manner: the ſaid dryed milke is good againſt venemous creatures and the plague, the ſame alſo eaſeth the paines in the head and eares, and is drunke by them that are ſplenetick.

1, 2. *Sycomorus ſive Ficus Ægyptia & Cypria.*
The Egyptian and Syrian Mulberry Figgetree.

CHAP. LXVIII.

Ficus. The Figge tree.

THere are divers ſorts of trees that are called Figge trees, very much differing in kinde one from another, I will therefore in this Chapter onely ſhew you the ſorts of our ordinary eating Figges that grow in *Europe*, and afterwards of the reſt, that have not beene declared before.

1. *Ficus ſativa ſive vulgaris.* The ordinary Figge tree.

This ordinary Figge in our Country in ſome places, I have ſeene as great almoſt, and as much ſpread as an Apple tree, with a grayiſh rugged barke on the body, and elder boughes and greene on the younger, which are hollow or pithy in the middle, the leaves grow ſingle on the branches, being long and large, thicke, rough, and of ſad a green colour on the upperſide, and whitiſh underneath, divided into three, but uſually into five parts, yeelding a ſharpe bitter, and almoſt exulcerating milke when they are broken, as the branches and the Figges alſo will doe when they are greene, the fruite breaketh out from the branches without any flower, and are both of ſundry colours, of ſeverall ſizes, and ripening at contrary times of the yeare, as alſo with thicker or thinner skins that cover them, theſe that are moſt ordinary are white, and of a reaſonable bigneſſe.

2. *Caprificus.* The wilde Figge tree.

This Figge tree differeth not from the former, but in growing not ſo great, and that the fruite is ſmall and hard, never ripening on the trees, but falling off unripe and are nothing ſo ſweete or pleaſant as the manured, that is ripe and mellow, or ſoft, but like it while it is greene and hard.

3. *Ficus nigra ſive præcox.* The blew Figge earely ripe.

This tree alſo differeth not in the growing from the former, but riſeth not to that greatneſſe, the fruite is alſo like the former, and of the ſame ſize and bigneſſe in *Spaine* and other places, but of a darke purple blackiſh colour, with an eye of blew as it were caſt over them, and blackiſh red throughout, being not fully ſo luſhious ſweete as the ordinary white Figge is: this Figge tree beareth twice in the yeare in the warme Countries, that is, in the Spring about *Aprill*, and afterwards in the Autumne when the other are ripe: thoſe in the Spring doe ſeldome ripen kindely, for want of the heate of the Sunne, and by reaſon of the moiſture of the ſeaſon, yet are they very delicious, ſo that they quickely both putrifie if they be kept long, and not artificially dryed, but quickely corrupt alſo in their ſtomackes that eate them, and therefore none dareth eate them, but they muſt drinke ſome Wine after them, to helpe to digeſt them, for if they paſſe not quickely out of the ſtomacke, but putrifie therein, they put them in danger to turne them into a feaver: and this is that kinde of great blacke Figge, that we have for the beſt kinde growing with us, which is uſually planted againſt a wall, and yet will not ripen the fruite with us, untill *Auguſt*, and then will be ſo mellow and ſoft, and moiſt that they will be ready to fall about their fingers that handle them.

4. *Chamæficus.* The dwarfe Figge tree.

The dwarfe Figge tree groweth not much higher with us then to a mans ſhoulders, with ſlender branches bending

1 *Ficus vulgaris.* The ordinary Figge tree. 4. *Chamæficus.* The dwarfe Figge tree.

ding downewards: the fruite or Figges are smaller, even in our Country then the last, but of the same colour, and reasonably well stored on them, this is tenderer then the other, and is usually planted in boxes, to be removed into stoves for the Winter time, and set abroad in Summer like our Orenge trees.

The Place and *Time.*

The manured Figge hath beene as I suppose alwayes planted where it grew in any Country, the wild being found so in sundry places, it is thought that both the other came out of *Barbary* into *Spaine*, *Italy*, and other places where they grow, and beare ripe fruite both in the Spring and *August*, or *September*, which in *Spaine* are after the gathering laid in the Sunne to dry, that they may the better be kept all the yeare after.

The Names.

The trée is called in Greeke συκὴ and the fruite σῦκον, in Latine *Ficus* both tree and fruite: the wild Figge tree is called in Greeke συκὴ ἀγρία and ἀγρεὸς by *Galen* and others, in Latine *Ficus sylvestris*, & *Caprificus*; the unripe fruite of the manured, as also of the wilde kinde is called in Greeke ὄλυνθος, and in Latine *Grossus*, but properly *Olynthus*, as well as *Grossus* doe signifie the earely ripe of each sort: the dryed Figges are called in Greeke ἰσχάδες, and of some κρεῖς, as *Paulus Æginetus* and others, in Latine *Caricæ*, yet *Pliny* saith that *Carica* is a peculiar kinde of Figge, growing in *Syria*, so you see the word is used both by Greekes and Latines, the graines or small kernells within the Figge is called by the Greekes κεγχρεμίδες, and by the Latines *Ficaria*, *Pliny lib.* 15. *c.* 19. calleth them *Frumenta*, the earely Figges are called in Greeke πρόδρομοι *quasi precursores*, in Latine *præcoces* and *Grossi* of some as is before said, the branches of the tree are called *Crade* both in Greeke and Latine, yet *Nicander* his interpreter doth call the Figges themselves so. In the West Indies where it hath beene planted by the *Spaniards*, it never looseth the leaves, God so providing them a remedy at all times against the venome of their Spiders, which is the milke comming from the tree, when the leaves are broken off. The first is usually called *Ficus sativa*, or *communis* by all: In our Summer Islands they grow so mellow, as that they will be dryed at no hand to be kept long, as those in *Spaine* are (which commeth to passe as I thinke, for want of skill in taking them in their fit time, that is, before they grow too ripe and mellow.) The second as I said before is called *Ficus sylvestris* and *Caprificus*. The third is called *Ficus nigra*, or *purpurea*, and of some *Ficus de Algarva*, yet some doe hold that the last or dwarfe Fig is more truely called so, and some that they may be both called *Ficus de Algarva*: it is generally called *Chamæficus*, or *humilis Ficus*, and *Ficus pumila* by diverse, *Lugdunensis* calleth it *Chamæyce arbore*. The *Arabians* call it *Sin*, or *Fin*, or *Tin*, the *Italians Fichi*, the *Spaniards Hygos*, the *French Figues*, and the tree *Figuier*, the *Germanes Feighenbaum*, the *Dutch Feigenboom*, and we in *English* Figges, and Figge tree.

The Vertues.

The Figge tree is hot, and of thinne parts, which the milke that issueth from the leaves and branches, being broken, and the juyce taken from them, when they are young and pressed forth, doe plainely declare, being exceeding hot, not onely biting and sharpe, or forcibly clensing, but even exulcerating and offending the mouthes of the veines, and taking away wartes, as also that it purgeth, yet is it not safe to take it inwardly, for feare of exulcerating inwardly, yea the branches of the tree are of such an hot temper, that if they be put to boyle with

Beefe

Beefe that is hard, it will thereby become tender and ſoft, the wilde Figge tree, and the milke thereof is more effectuall then that of the manured: if the leaves of the Figge tree be rubbed over the piles, they will open againe and bleede: the Figges themſelves are hot and moiſt, and nouriſh well, the dryed better then the greene, ſo they be temperately taken, for the continuall uſe of them breed ill blood, puffe up the body with looſe fleſh, and cauſe them to become louſie; yet *Galen* ſaith that the uſe of Figges and Grapes in his old age, above all other fruit did him leaſt harme: if they be eaten while they are freſh and greene, they looſen the belly, but doe ſomewhat trouble the ſtomacke: the dryed Figges doe heate the ſtomacke, and cauſe thirſt, yet they nouriſh and are good for the throate, and arteries, the reignes and bladder, and to regaine a good colour to them that by long ſickneſſe have loſt it: Figges are one of *Mithridates* three ingredients into his antidote, againſt both poyſon and Plague, as you have heard before in Wallnuts and Rue: the decoction of Figges, Hiſſope and Licoris, is a very good Ptiſane drinke to helpe an old cough, hoarſeneſſe and ſhortneſſe of breath, and all the diſeaſes of the breſt and lungs, and is good alſo in dropſies, and the falling ſickneſſe, and for the Quinſie alſo, a ſlit figge toſted and held to an aking tooth, doth often eaſe the paines; two or three Figges ſlit, and laid all night in *aqua vitæ*, are very good for thoſe that are purſie and ſhort winded, to take them in the morning. Figges bruiſed and applyed with Barley meale, and the pouther of Fenugrecke ſeede doe molliſie the hard tumours and kernells, under the throate and eares, and elſewhere, as alſo the hardneſſe of the Mother, and if ſome leaven and ſalt be put to them, it breaketh Plague ſores, and it may be was the ſame *Hezechias* uſed: they are mixed alſo, not as *Pliny* hath it, with χάλκε ἀνθος, *id eſt flore æris* (but with χάλκανθος *Calcantha*, that is, *Copperas*, as *Dioſcorides* hath the word being miſtaken by *Pliny*,) againſt the inveterate ſores of the legges, and all other foule running ulcers: being boyled in Wine with Wormewood, and then applyed with barly meale, are very profitably applyed to the belly of thoſe that have a dropſie: and beaten with ſalt and applyed, taketh away the itch and ſcab, and the aſhes alſo of them being made up into a ſalve and applyed, healeth kibes, and chilblaines: the dryed milke of the wild Figge tree, as well as the tame doth curdle milke like renner, and diſſolveth it being curdled, as vinegar: this milke or the juyce taken from the young lancke branches, is moiſt fit to uſe inwardly againſt the poyſon of *Gypſum*, and the *Phalangium* Spider, but outwardly applyed it is good for many things, as put into an hollow tooth, it eaſeth the paine, the ſame mingled with the juyce of Muſtard, and dropped into the eares, eaſeth the paines, noiſe, and itch in them, and helpeth the deafeneſſe; applyed to a place bitten or ſtung, by any mad dogge or venemous creature, taketh away the paine and danger together: the ſame alſo made up with Barley meale, healeth the running ſores of the head, and likewiſe helpeth the Lepry, Morphew, the white ſcurfe, and moiſt ſcabbes, puſhes, wheales, and all other eruptions in the skinne, or diſcolourings in the face: the lye that is made of the branches of the wilde or tame Figgetree, being burnt to aſhes, after it is cleered, is accounted among cauſticke medicines: it helpeth running cankers and Gangrenes, and conſumeth Warts and Wennes, by dipping ſome Wooll or Spung therein, and dayly applying it thereto, and is ſometimes dropped into hollow Vlcers, that fret and creepe, and are full of moiſt humours, for it cleanſeth, ſodereth, and bringeth up fleſh therein, and cloſeth up the lippes thereof, like thoſe plaiſters that are applyed to greene wounds: it is likewiſe drunke by them that have the bloody flixe and old deflu&ctions; to diſperſe alſo the congealed blood in the body, by any bruiſe or fall, adding thereto a little oyle and water, and ſo it is taken by them that have either rupture or convulſion. *Ruellius* ſaith, that if a Bull, be he never ſo mad, be tyed to a Figge tree, he will quickely become tame and gentle: and ſome have affirmed, that the Figge tree and the Bay, are not blaſted with lightning. The blew Figge is no doubt of the ſame operation with the white to all purpoſes, but the fruite commeth moſt to maturity with us, and eaten with great pleaſure with ſalt and Pepper.

CHAP. LXIX.

Muſa arbor. The Indian Figge or Plantaine tree.

DIvers doe make this tree (or plant, whichſoever you pleaſe to call it, in that it dyeth yearely) one of the ſorts of Dates, but very erroniouſly, for it may in my judgement be more truely referred to the Figges; as divers others doe, and therefore I thinke meeteſt to be joyned unto them. It riſeth up to the heighth of ſixe or ſeven cubits, with a ſtreight ſtemme or ſtalke, as bigge as ones thigh or arme, not wooddy at all, but of a ſoft ſubſtance, and as it were compoſed of a number of foulded leaves together, ſo that it may eaſily be cut downe with the blow of a ſword, or with a knife, with a pith like marrow within, not ſpreading any branch at all, but compaſſed about with many very large leaves, foulding themſelves as they riſe, like the leaves of the flowring Indian Reede; which when they are ſpread open at large, are each of them a fathome ſometimes or more, and uſually foure or five foote long, and two foote, or ſometimes a yard broad, hanging almoſt quite downe, with a great thicke rib running through the middle, and not cut in on the edges in any place: the lower leaves ſtill falling away being dryed, and broken off with the winde, leaving the ſtemme or ſtalke bare, untill it have attained unto above a mans height, where it buſheth forth a many the like large leaves, that are of a darke greene colour on the upperſide, and paler underneath; in the midſt whereof thruſteth forth a great long bunch of flowers; as bigge as an Eſtridge egge, of a ruſſetiſh purple colour, divided into many cluſters, each flower whereof ſaith one is *Lilionarciſſo major, foliorum extrema ſubſtringens colore phœniceus*, after which ſucceede the fruite growing in the ſame manner in cluſters, at ſeverall ſpaces or diſtances of the great long ſtalkes, two or three hundred many times together, each whereof is long and round, in ſome places greater and ſmaller then in others, ſome a ſpan long or more (and one ſort in the Kingdome of *Congo*, is ſmaller, but better reliſhed then the ordinary, yet rare and not to be found but in very few places elſe that I can learne) ſomewhat reſembling a ſmall Cowcumber, of a firmer ſubſtance then a Figge when it is cut, and without any graine or kernell within it, having a little hollowneſſe in the middle, where it may ſeeme to be parted in twaine, and are of a darke greeniſh colour being unripe, but of a whitiſh yellow if they be ſuffered to grow to the full maturity, but many doe cut them downe before they are through ripe, and either hang them up in their houſes to ripen, or to carry to Sea to ſpend afterwards, for being gathered ripe, they will not laſt long: the outer skinne is to be pared or peeled away before

Minor ex ſapiaſor.

before they are eaten, the inner substance being yellowish, and of a fine sweete taste, not suddenly to be perceived, yet I having tasted of one that Doctour *Pay* gave me, did thinke I had tasted of an Orris roote, preserved with Sugar, which peradventure was not the naturall rellish thereof, but ascititious. Vnder the stalke with fruite, hangeth downe on another stalke, a tuft of leaves, which some while after will bee another bunch of fruite, usually bearing twise, and in some places thrice every yeare: when the stalke is cut downe, some say that it yeeldeth a kinde of water like milke, both for colour and taste, some say also that the roote beareth but once or twise, or thrice at the most: but the certainety is, that it needeth to be but once planted, for that it continually sendeth forth new stalkes, as the old decay, and in some Countries are soone ripe after they spring, and will have ripe fruite, from some of the plants at all times.

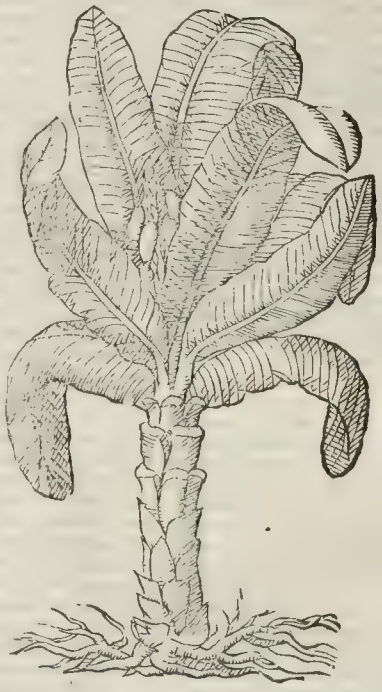
The Place and *Time.*

This generally groweth in most Provinces of the East, as well *Egipt* and *Syria*, as the Indies; it groweth also in *Brassill*, but is planted onely in the West Indies, in *Cyprus* also it will doe reasonable well, but not so in *Candy*, but in *Spaine* or *Portugall*, as I heare, it will not beare at all. *Africa* also and *Ethiopia* wanteth it not, and as is said, hath ripe and greene fruite almost all the yeare long.

The Names.

It is very probable that this plant was not knowne to *Theophrastus* unlesse it be that which *lib.* 2 *c.* 8. he saith groweth in *Cyprus* with a large leafe, and a much greater fruite, but is not savoury like the rest: and therefore *Guilandinus* refuseth it, nor yet since his time to *Dioscorides* or *Galen*, no nor to *Pliny*, unlesse as *Clusius* and others thinke, it may be his *Pala*, mentioned in his 12 Booke, and 6 Chapter, whose fruite was called *Ariena*, of a wonderfull sweetenesse, one whereof was able to satisfie foure men, the leafe thereof being three cubits long and two broad, which is somwhat likely, in that as *Garsias* saith, it is yet to this day called *Palan*, in the Country of *Malabor*, which is on this side *Ganges*, and beyond *Indus*: it is diverslly called, every Country almost, giving it a peculiar name, they of *Malayo Pisan*, they of *Bengala* Quelli, in other places of the Indies *Melopalanda*, in *Malavar* also *Chincapalones*, they of *St. Thomas* Iland *Abella*: it is said that some doe call one sort *Senoryns*, and another *Cadolyns*, the *Portugals* call them *Figos dorta* and *Figos de Cananor*, others *Ficus Martabana*, of some also *Ficus Pharaonis*, they of *Ginney*, and in the Realme of *Congo Bananas*: *Lodonicus Romanus*, and *Brocard*, who wrote the description of the Holy Land call it *Adams* Apple, whom *Cardanus*, and others doe follow, supposing it to be the fruite that *Eve* tooke and gave to *Adam*: but the very text of the Scripture convinceth that errour, for it is there said, that they sowed Figtree leaves together, to make them aprons to cover their nakednesse, when as one leafe hereof had beene sufficient. Some also as *Bauhinus* setteth it downe, call it *Dudaim*, but I thinke that name better agreeeth to the Mandrake. Of the *Arabians* *Serapio*, and *Avicen* *Mauz*, *Musa*, *Amusa* and *Mauim*; of the Moores *Muz*, and *Gemez*, of some Greekes and Latines *Margarita*: they of

Musa arbor.
The Indian Figge or Plantaine tree.



Musæ arboris fructus. The fruite of the said Indian Figge or Plantaine tree.

Brassile

Brassile call the tree *Paquonere*, and the fruite *Bacova*, *Oviedus* and *Acosta* call it *Platanus*, for what cause is not knowne, unlesse the largenesse of the leaves enforced that title, but from thence I thinke hath risen the name of Plantaines, whereby our *English* in all places call them by. The *Italians*, *Spaniards*, *French*, and others follow the Latine name *Musa*, and so would I it should be called, or the Indian clusterfigge, to distinguish it from the other sorts of Figges, that they be not confounded, but not *Adams* Apple as *Gerard* doth, from the superstitious conceits of *Brocard* or others, for wee might as well follow that foolish *Franciscans* that would transferre it to the Muses, as gratefull to them. The *Portugals* have a conceit, that if this fruite be cut either thwart or aslope, there will appeare the forme of a crosse therein, and therefore they will not cut any, but breake them all that they eate, which vaine conceit it is likely they have taken from the *Maronite* Christians, as *Linschoten* saith.

The Vertues.

It is generally held that no man ever tooke harme by eating the fruite hereof, onely by the much eating of them they have become loose and soluble in their bodies, but that they comfort the heart and refresh the spirits: they are also good for coughes, and hoarsenesse, and to lenifie the sharpenesse of humours, descending on the lungs: it is also profitable for those whose urine is hot and sharpe, and to provoke it being stopped, stirring up also bodily lust: but they that have any feaver or ague must forbeare them, but are good for women with childe to nourish the birth: although this may seeme to be somewhat hard of digestion to weake bodyes and stomackes, yet to stirring and able persons it is not so: the fruite being cut in the middle long wise, and dryed in the Sun, is then more delicate then a Figge: being baked in an oven, it is no lesse pleasant or boyled in broth, yet it will not abide any long boyling. The leaves being soft are commended to coole such as shall lye upon them, and keepe them temperate in the great heates: some also with good effect apply the juyce of the leaves to places burnt with fire.

CHAP. LXX.

Ficus Indicus spinosus. The prickely Indian Figge.

WE have observed two sorts of this Indian Figge, the one greater, not to be preserved a Winter in our Country without a great deale of care and conveniency for it, the other lesser, abiding reasonable well with us: they that set forth the *Peruan* History, doe say that there is two sorts of wilde, one bearing no fruite, and another so prickely, that it serveth to no use, besides the manured which beareth the graine, but with these I must declare the breeding of the *Cochenille*, which is that graine which the Dyers use, and is said to be gathered from of these plants, or one of them.

1. *Ficus Indicus spinosus major.* The greater Indian Figge.

This greater Indian Figge groweth in some parts of the West Indies to have a body or trunke as bigge as ones arme or thigh, and from thence shooteth forth his leaves, but in other places, it groweth from a leafe first set into the ground, and there shooting forth rootes, and others rising out thereof on all sides, and others out of them; and so one out of another, being formed into branches of such leaves, like unto branches of other trees, each of these leaves are very large, and as thicke as ones hand, and larger in many, beset with small sharpe, and somewhat long white prickes or thornes; dangerous if undadvisedly they be handled, but in *Europe* they are not so thicke set, nor so sharpe but in many places of the leaves, the knots or places where they stood are void: the flowers come forth at the toppe of the fruite, which is at the first like unto a leafe it selfe, and breake out on the side of the greater leaves sometimes, as well as on the tops composed of eight or twelve pale yellow leaves, set in a double row with certaine yellow threds tipt with red in the middle: after the flower is withered, yet still abiding on the head of the fruite, it groweth greater and sheweth it selfe to be long, and rounder then the leaves, and flatter at the head, and like unto a Figge, which fruite also is armed with prickes as well as the leaves, and is whitish, which is taken to be the better, or of a reddish or yellowish colour on the out side, or greenish and very red within, full of a watery substance, tasting sweete and pleasant, with diverse seedes therein, and by eating

1,2. *Ficus Indica spinosa major vel minor.* The greater or lesser prickely Indian Figge.

them will cause the urine to be tincted like blood it selfe: the roote groweth neither deepe nor farre abroad.

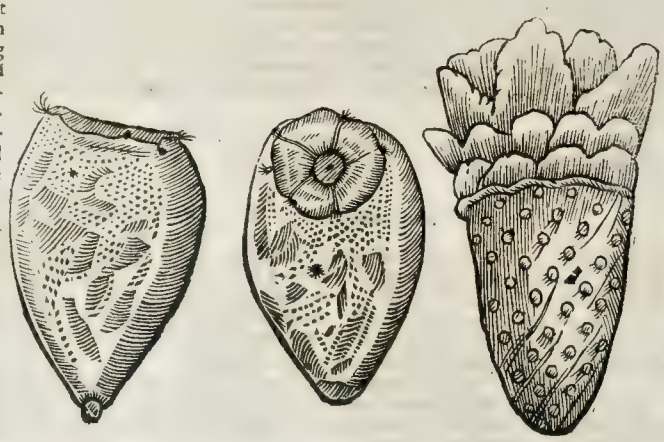
2. *Ficus Indicus spinosa minor.* The lesser prickely Indian Figge.

This lesser Figge groweth more often with us, from leaves as farre as I can learne, yet I have knowne it rise from the sowne seede, and never into a body or stocke like the former, and is in all the rest as like it as may be, without any difference but onely the greatnesse, which in this is neither halfe so great or thicke, or the growth halfe so high, and this declaration may be sufficient to describe it by comparing the former discourse herewith that I doe not make a double repetition of one thing.

3. *Cochenille sive Fici Indici grana.* The Dyers graine called Cochenille.

There hath beene much doubt and many variable opinions, concerning the breeding of the Cochenille, some taking it to be the *Coccognidium verum*, others to be the *Chermes Arabum*, and that it differeth not from the *Coccus Baphicus* of the *Grecians*. *Fragosus* would seeme to know more then others, and in his third Booke and 15. Chapter, saith that they are certaine graines that grow in *Peru*, at the rootes of certaine small plants, that are like unto the common Burnet Saxifrage, cleaving to the rootes of it like wild Grapes, but is utterly erronious for *Peru*, his opinion as it seemeth being taken from *Angulara*, and *Lacuna*, who say that there are certaine graines found in some places here with us, growing on the rootes of the Burnet Saxifrage, whose inner pulpe doth give a crimson dye, and is therefore called *Coccus radicum*, that is, the roote graine: some have taken them to be flyes, or such like covered with a small thin skin or case, and sticking under the leaves of this Indian Figge: but *Ioannes de Laet* of *Antwerpe*, in his fifth Booke and third Chapter.

Fici ejusdem Indici fructus. The fruite of either of the Indian Figge trees.



page 229. of his description of the West Indies, sheweth us the truth hereof more exactly then *Oviedus* or many other that have written thereof I thinke, and saith that besides the two wild sorts, whereof one giveth no fruite and the other so prickely that it is of no use, and the tame or manured sort that beareth fruite that is very sweete and of a most pleasant taste, and either white which is esteemed the best, or red or purple, which dyeth the hands with a blooddy colour, even as Mulberryes will doe, and being eaten coloureth the urine also into the same blooddy colour. There is saith he another sort, called by the Indians *Nochezcli Nopalli*, or *Nopall Nochezcli* which although it beareth not such like fruite, yet it is more accounted of, and husbanded with more care and diligence because it beareth that precious graine *Cochinille*, so called by the *Spaniards*, as a diminitive from the *Coccus* of the auncients, so much sought after, and used by Dyers, for the excellency of the colour: This plant loveth those places that are temperate: *Herrera* describeth the manuring and ordering thereof, and *de Laet* from him in this manner: The graine Cochenille is bred on the tree which is called *Tuna*, in very many of the Countries of the West Indies, and new *Spaine*, which hath most thicke leaves, whereby it is encreased in those places that are open, and yet defended from the North: It is a living creature, or rather a kinde of insect or flye, not much differing, but comming neere unto a punie or wall louse, being somewhat lesse then a flea, when it first getteth to the plant, and bred from a seed no bigger then an hand worme, and doe so loade the trees, and fill the whole Garden, that they must gather them twice every yeare from the trees, which they set in order and tend like their Vines, and free them from weedes, or what else may hurt them: the younger the trees be, the more plentifully will they beare, and the better graine, but especially it is necessary for them to cleere them from the other sorts of flyes, and no lesse keepe away their hens, who will devoure the graine: and to cleare their trees from the encrease of these other sorts of flyes, they use Foxetailes, and when they are growne full ripe, they gather them with great care, and kill them by casting cold water on them, and dry them in the shaddow, and keepe them in pots: some kill them by casting ashes amongst them, and afterwards wash them, and others choke or kill them by some other wayes: but it is the best way to kill them with cold water. But now this graine is adulterated by the Merchants, after divers manners, for there are foure sorts to be found hereof: the one giveth a colour of no great worth, as being a wilde sort and not manured: another is blacker, which groweth also of it selfe, without care or husbandry, a third is a mountainous sort called *Chichimeca*, and of a meaner regard, all which they mingle together with the fourth, that is the best and manured. The divers sorts hereof among the Merchants have severall names, according as the *Spaniards* call them: every sort according to the goodnesse hath a name whereby they know it, as *Silvester* and *Tuskaliobe*, the two worst sorts, being of a blacke dull colour, yet the largest graine. *Musteko* is a gray sort, and is the most ordinary we have, but the *Golbaca*, is in colour betweene both, in fine no bigger, but in goodnesse much excelleth them all, and is not much inferiour to the *Rosetta*, which is the

the reddeſt in ſhew, and the richeſt in uſe of all. And *Tlaxcala* giveth the beſt ſort of graine by far, *Franciſcus Zimenez*, writeth that this plant bringeth forth a certaine gumme, which doth temper the heate of the reines, and of the urine, and that the juyce or water diſtilled from it, is a wonderfull remedy againſt peſtilentiall and chollericke feavers. The Chochenille or graine it ſelfe is held to be very cordiall, and to drive infection from the heart, for it is familiarly given both to the infected with Plague, Small poxes, or other infections or dangerous ſickeneſſe.

The Place and Time.

Both theſe ſorts grow in the Weſt Indies, the greater ſort all the Indies over, from *Florida*, and the other on this ſide it, where the greater is not found, as being a colder Country then that the greater can live in it, and flowreth with us about the end of *May*, or in *June*, and the fruite ripeneth not with us kindly at all, but abideth on all the Winter, and the next Summer too, and yet will be greene on the outſide, and wateriſh or unſavoury, although ſomewhat reddiſh within, but more red within than without, and ſweete alſo in the naturall places.

The Names.

Divers Authours have given divers names unto theſe plants, for *Matthiolus*, *Dodonæus*, *Lacuna*, *Lobel*, *Ceſalpinus* and others call it, *Ficus Indica*, divers of the Indians that be Iſlanders call it *Tuna* or *Tunal*, they of *Mexico* and thereabout *Nochtli*, and as I ſhewed before *Nochezcli Nopalli* or *Nopall Nochezcli*, and in ſome places alſo *Cardi*, but that I thinke is by the *Spaniards*, and thereupon it was called *Cardaus Indicus*, and *Ficus Indiæ*: diverſe did take it to be the *Opuntia* of *Theophraſtus* and *Pliny*, but erroniouſly, for they both ſay, it is an herbe fit and ſweete to be eaten, but the leaves of theſe are not uſed to be eaten, neither is it an herbe or plant, naturall to any of the nations of *Europe*, *Africke* or *Aſia*, but a peculiar kinde of it ſelfe; but *Opuntia* is an herbe growing naturally about *Opus*, and is uſually eaten, and therefore this cannot be it but another herbe, as I have ſhewed in the Chapter of *Opuntia marina*, among the Sea plants: ſome alſo call it *Pala arbor Plinij*, as *Belonius* and *Anapallus* alſo: The leſſer ſort is called by *Lobel Indorum ferruminatrix*, and *Opuntia Oſtocollos*, and by *Bauhinus Ficus Indica folio ſpinoſo fructu minore*.

The Vertues.

It is ſaid that the Indians uſe to lay theſe leaves bruiſed upon places that are put out of joynt, or the ſinewes or Arteryes over ſtretched, and to helpe thoſe that are burſten or broken to knit up the places againe: the juyce of the leaves is with good ſucceſſe uſed in foule ulcers or ſores: The vertues of the graine are ſet downe a little before at the end of the declaration thereof.

CHAP. LXXI.

Ficus Indica arcuata.
The arched Indian Figge tree.

Ficus Indica Arcuata.
The arched Indian Figge tree.

THis admirable tree for ſo it is called by many, groweth to be a great tree, and tall, ſpreading many armes all about, and very long which by reaſon of the ſlenderneſſe and length, bend downe to the ground, ſhooting forth certaine yellowiſh ſtringes at their ends, which as ſoone as they come to the ground, doe thereinto thruſt themſelves as ſtrongly as the firſt, which againe ſend forth other branches after a while that they are well growne in the ſame manner as the firſt, for they alſo in time grow great, and ſpread their branches, which likewiſe bending downe take roote againe, and thus ſucceſſively one after another, untill it hath taken up a great compaſſe of ground, even a mile as it is ſaid in compaſſe, and made as it were a Grove or Wood from that one firſt tree, whereunder the Indians doe ſhelter themſelves from the heate of the Sunne, and ſo prune away the under boughes, and branches that they make divers walkes and croſſe wayes through theſe trees, leaving their branches over head as arches to paſſe under to and fro, and cutting out ſome looke holes as it were, to give light and ayre to a thouſand men, and more that may be ſheltered under the ſhaddow of this one tree, with the Suckers thereof, among ſo many of whom it is hard to finde out the originall or mother ſtocke. the leaves on the young branches are like unto Quince tree leaves, greene on the upper ſide, and hoary white like them underneath, wherewith Elephants are much delighted to feede, and whoſe branches they cut downe to give them: the fruite groweth among the branches no bigger then the end of ones thumbe, but faſhioned like a Figge of

blood red colour both within and without, somewhat sweete like unto them, but not so pleasant.

The Place and *Time.*

This tree groweth in divers places of the East Indies, as at *Goa, Malacca, &c.* and abideth alwayes green giving ripe fruite at the time with others in that Country.

The Names.

This tree is mentioned first by *Q. Curtius, lib. 9.* who wrote the acts of *Alexander,* in his warres into th Indies, and by *Theophrastus* also *lib. 4. c. 5.* who lived neere that time, and calleth it *Ficus Indica,* as *Pliny* al *lib. 12. c. 5.* after him doth *Strabo* also although hee gave it no name then, or of the admirable tree, yet here by you may perceive that it is no new found tree in these later dayes, but knowne and written of by the Anc ents. *Goropius* would draw this tree into Paradise, and make it the tree of the knowledge of good and evill, tha God had planted in the midst thereof, and forbad *Adam* the eating, and of which by eating, he brought a woe o himselfe and his posterity, so bold is he to take upon him to know that which he hath no authority or proofe fo but onely led by fansie and strong conceit, about the river *Acesine,* in those parts where this groweth, and there fore Paradice must needs be there also. The *Portugals* call it *Arbor de ray,* that is the tree of rootes, and there upon *Linschate* in his Booke figureth a tree with a number of rootes thereto, rather out of fancy then sight whic *Clusius* mistiked. Some doe call it *Arbor Goe,* but of most *Ficus Indica,* and I have added *arcuata* for a diffe rence from others.

The Vertues.

The fruite is good and wholesome to be eaten, but I cannot learne if ever it was applyed to cure any wound o ulcer in the body, or used in Physicke, for any disease.

CHAP. LXXII.

Pyrus. The Peare tree.

BEcause Peares are so like unto Figges in the outward forme of them, I thinke good to joyne them next thereunto, whereof there is both manured and wilde: the manured doe transforme themselves into so many severall fashions, colours, and tastes, that it would take up many leaves to describe them at large as they might be, for not onely every Country abroad, and beyond the Seas, have severall sorts, which we never saw or heard of, but in our owne Land also, there are so many that it is almost impossible that they should all come to one mans certaine and perticular knowledge (yet have I shewed you a many of them in my Orchard heretofore.) Of the wild sorts likewise there are

1. *Pyrus sativa.* The manured Peare tree.

2. *Pyrus sylvestris.* The wilde or Choke-Peare tree.

both

both abroad and at home such variety, that a man might spend his whole time thoroughly to observe and set downe all the sorts that are knowne in other places. I will therefore endeavour but to shew you here a generall description of the tree, both tame and wilde, with some sorts that are not expressed in my former Booke.

1. *Pyrus sativa.* The manured Peare tree.

The manured Peare in generall groweth higher, but slower then the Apple tree, more upright also and not spreading the branches, and no lesse thicke, but rather greater in the bulke or body: the leaves are somewhat broader and rounder, greene above and whiter underneath then those of the Apple tree: the flowers are smaller but whiter then the Apple blossomes, and the fruite more long then round for the most part, smaller also at the stalke, and greater at the head, of many differing fashions, sizes, colours, and tastes, and times both in gathering and spending, some being greene, some russet, other yellowish or reddish, some great, others small, or long, or round, or smooth, or bunched out, and so for tastes also, sweetish or lushious, or delicate or waterish, or hard and firme, and well relished, or not so good to be eaten raw, as baked or roasted, and some to be spent as soone as they are gathered, or soone after, being Summer fruite, others not to be spent untill the Winter be either come in, or neere or fully past; each particular to every fruite were too tedious: for this Worke being growne already so voluminous, and seeing I have shewed them in part elsewhere: The wood is smooth close and firme, and serveth for many uses, both for formes to cut these figures or the like in, and instead of wainscot in many poore mens houses, and for many other purposes.

2. *Pyrus sylvestris.* The Wilde or Choake Peare tree.

The wilde Peare tree usually groweth tall and upright, like the manured kinde, and as little spreading, but sometimes low and crooked, but fuller of branches, which maketh them the more knotty, the barke is blacker and more rugged, cleaving also in many places, and easily to be pulled off; with prickes and thornes set here and there on them, but not so thicke as in the Crab, the leaves and flowers doe little vary, but that some will have larger and others lesser leaves and flowers, which will also be a little deeper coloured then others, as the fruite being greater or smaller, and of a more or lesse harsh taste, although all have some, and the colour likewise in some is greene or darke russet, and some will be so faire, yellow and red, that they would invite any that seeth them and knoweth them not to take and taste of them, which then are so different from their expectations, being harsh and unsavoury, that they presently out with their purses and bestow this adage there on, *Non est semper fides habenda fronti*: yet this harsh unsavoury fruite, though later ripe then most of the manured sortes, by being in part mellowed with the Autumnes coldes, and the standing of their juyce being pressed forth and made into Perry, doth in time so alter his former quality of harshnesse and unsavourinesse, that it becommeth fully as cleere, and almost as pleasant as white wine: the wood hereof is harder, firmer, and closer then the former, and so more knorty also, whereby it becommeth more frangible and sooner broken.

Of the manured Peares there is a sort that although it be a good Winter fruite, sweete and well relished, especially if they be stewed or baked, yet the tree hath thornes upon it, like unto the wild sort, this was brought as it is said from *Naples* into *Lyons*, where it is plenty, and called *Poirier d' espine*, and the fruite *Poire espine*, that is, *Pyrus sativa spinosa*, the prickely Peare. *Pyrus spinosa sativa.*

The winged Peare hath a leafe alwayes, or two sometimes, growing to the sides of it, as if it came out of the Peare, and may therefore be called *Pyrophilla*, whereof *Camerarius*, speaketh in *horto*.

The Pome-peare, or Apple-peare, which is a small Peare, but round at both ends like an Apple, yet the tree is a Peare tree. *Pyrus foliata. Pomifyrus.*

The Blood Peare, whose inside is red, as the outside is. *Camerarius in horto* maketh mention hereof likewise. *Pyrus sanguinea*

The Laxative Peare which looseneth the belly being eaten. *Camerarius* there also hath this. *Pyrus Laxativa*

The double blossomed Peare. This bore double flowers with Master *Ward*, of the Kings Granary, but whether it be alive or dead, I am not assured; nor whether it kept the forme, or did alter. *Pyrus flore duplici.*

Pyrus sylvestris. The wilde Peare tree.

1. Of the wilde kinde there are the great red Choke Peare, whose colour and property, I have shewed you in the description.
2. The smaller Choke Peare.
3. The Hedge Peare.
4. The lowsie Hedge Peare.
5. The Crow wild Peare.

6, 7. Wild Peares of *Candy*, the one they call *Achlades*, the other *Agnsaga*, as *Bellonius* saith.

The Place and *Time.*

The manured sorts are onely planted and preserved in Orchards for the purpose, the wilde sorts being some found in our owne Woods, and planted in the Hedge-rowes of fieldes, to save the ground of their growing, and yet have as much use of them as by being abroad, the wild flowring and ripening their fruite later then the manured.

The Names.

The manured Peare is called in Greeke ἄπιον, and in Latine *Pirus*, and *Pyrus a fructus figura quod ad Pyramidalis similitudinem, elato in mucronem turbinetur*: The wild Peare is called ἀχερὰς in Greeke, by *Theophrastus*, *a privativo usu, quod non sit in usu fructus ejus ad humanum corpus*, yet *Dioscorides* saith, ἀχερὰς is a kind of wilde Peare of it selfe, and ὄχρυς, in Latine *Pirus sylvestris*, and *Pyraster*, or *Piraster*: all peaceable ages have beene much delighted with the variety of all sorts of edible fruites, and therefore *Cato*, *Columella*, and others, but especially *Pliny* hath set downe the names of a number, as they were well knowne in his time which how our age can parallell ours unto them, I cannot tell; yet *Lugdunensis* hath in some sort endeavoured it to his *French* names, but how truely I know not, nor is it greatly materiall for us to doe, because names are often given from the place where they best grow, or from the person that first brought them into their Country, or was much delighted with them, or from some other cause or accident, which names are not so fit for one Country as another: Wee have so many in owne Land, that I never knew any one that could be possessed of all sorts, although they strove to doe it as much as in them lay, for still they were informed of some they had not: And I have declared a many of them in my former Booke. The *Arabians* call it *Humecthe*, *Cirmetre*, and *Kemetri*, the *Italians Pere*, the *Spaniards Pyras*, the *French Poires*, the *Germanes Bir Biren*, and *Piren*, the *Dutch Berre*, and we Peare.

The Vertues.

Peares of any good or reasonable rellish are more spent for meate then medicine, and most of them eaten raw at severall times as they be fittest to spend, or else stewed or baked, as the kinde doth best sute, and every one list to use them: the sorts also that are fittest for the purpose are dryed in ovens to keepe all the yeare, being an excellent repaste: some are preserved in Sugar, as other fruites are, and served in banquets among other sweet meates, or dryed up after they are preserved and so put among other dry candid Iunckets. The Warden is chiefly, yea onely admitted to be taken by the sicke, and aguish in that it hath no actriction therein to breede obstructions, which are the utter enemies to putrid feavers. The wilde Peares by reason of their harshnesse, are not eaten as the milder sorts are, except some good kinde stewed or baked, to serve the poore peoples dyet, the other scarse fit for the hogs to eate, and therefore are for the most part where store of them grow, beaten and pressed into a liquour which is called Perry, of especiall good use at Sea in long voyages, to mingle with their fresh water, to make it the more healthfull, or lesse offensive to those that must continually drinke water: and will after some time become so milde almost as Wine, and fit and wholesome to be drunke: The Physicall uses of them both are these: They are to be discerned best by their tastes, for according to *Galens* rule, the harsh or sowre doe coole and binde, the sweete doe nourish and warme, and those that are neither much sweete or sowre, but betweene both, have answerable qualities to their degrees: all the sweete or lushious sorts doe helpe to moove the belly downewards more or lesse, but that sort much more, which hath the name of the Laxative Peare: those that are harsh or sowre, doe on the contrary part binde the belly as much, and the leaves doe so also: those that are moist doe in some sort coole, but the harsh or wilde sorts much more, and serve well to use in all causes, where there is neede of repelling medicines, and if the wild sorts be boyled with Mushromes, it maketh them the lesse dangerous, and it is said also that the ashes of the Peare tree wood being taken in drinke, or the lye of them being drunk, doth helpe them that are like to be choked with eating Mushromes: The said Peares boyled with a little hony, doth help the stomack very much, that hath any paines or oppression therein, all sorts of them somemore or lesse, but the harsher sorts doe most coole and binde outwardly applyed: and serve well to be bound to greene wounds, to coole and stay th blood, and to helpe to heale up the wound without inflammation or further trouble: Which course *Galen* himselfe as he saith was driven to use upon an exegent not having any other thing at hand for the purpose: Wild Peares therefore in the like case doe more close up the lippes of greene wounds then the other. Perry is a drinke that whosoever useth at home being not accustomed to it, will wring them a little by the belly, and will a little force it downeward, but being more used it worketh not so at all, but rather cooleth an hot or fainting stomacke, helping the digestion being temperately taken: but at Sea by the working thereof it is made more comfortable, taking away the crudity and rawnesse of the water.

CHAP. LXXIII.

Malus. The Apple tree.

THe Apple likewise is divided into tame or manured, and wilde, the one serving for Orchards, to be tended and regarded, the other to be left to the Woods and Hedge rowes of fieldes, &c. as I did therefore with Peares in the former Chapter so I meane to deale with Apples in this, give you a generall description both of tame and wilde, and the other sorts, that is, especially the Wildings or Crabbes, which were not mentioned in my former Booke.

1. *Malus vulgaris.* The common Apple tree.

The Apple tree in generall spreadeth his armes and branches more then the Peare tree, but riseth not to that height, the leaves are somewhat round, a little long pointed towards the ends of them, and dented about the edges greene both above and below: the flowers white and a little blush coloured about the edges, consisting of five leaves, the fruite that followeth in this as in the former, is of divers sizes, formes, colours, and tastes, and likewise of variable ripening and lasting, for some will be rotten before others be ripe, and some must be spent, before others be gathered.

Flore duplici. The double blossomed Apple differeth from the former in nothing, but in the flowers, which are double, and that it beareth no fruite.

2. *Malus sylvestris.* The Wilding or Crabbe tree.

The Crabbe groweth somewhat like the Apple tree, but full of thornes, and thicker of branches the flowers are alike, but the fruite is generally small and very sower, yet some more then others, which the Country people to amend, doe usually rost them at the fire, and make them their Winters junckets: whereof some are redder or whiter, or greener, or yellower then others, being seldome much regarded, or distinguished more then to make Cyder or Verjuyce of all sorts being indifferently put together.

3. *Chamæmalus.* The dwarfe or Paradise Apple.

The Paradise Apple is also a kinde of wilde Apple, yet no Crab, for it is not grafted like the manured sorts, but as the Crab, riseth without grafting to be a tree of low stature, not much higher then a man may reach, having leaves and flowers like the former: the fruit is of a reasonable size, faire and yellowish, but light and spongy, of a bitter sweet taste, not pleasant, and will not last long but quickely shrinke and wither: the body and branches are much subject to the Canker, which will quickely eate it round and kill it, and besides will have many scaboy bunches that deforme it and cause it to perish, and this as it groweth elder, for it is full of suckers, from the roote, which will be as faire and smoth, as of any other tree.

Of the manured sort there is one whose flowers are wholly white & smaller, the tree lower and the fruit smaller.

Pomiuana. There is another which hath no kernels within the core.

Of the manured kinde, the *Holland* Pippin must be remembred, which is a flat and yellowish greene Pippin, and of as good a rellish as most of the other Pippins, and of a meane size.

Of Wildings or Crabs, there is the Towne Crab, the greater and lesser red Crab, the greater and lesser white Crab, and the small hedge Crabbe.

The

Malus. The Apple tree. *Malus syluestris.* The Wilding or Crabbe tree.

The Place and *Time.*

The better sorts of Apples are planted in Orchards, and some of the other, as the dwarfe kinde, the Wildings or Crabs grow in Woods generally, yet are planted in the hedges in many Countries of this Land to make Cyder withall, the Apples in generall flower, and bud forth leaves later then Peares, and ripen earlier or later for the most part, according to the kinde.

The Names.

It is called in Greeke μηλέα, and the fruite μῆλον, in Latine *Malus* and *Malum*, or *Pomus* and *Pomum*, yet *Pomum* is a generall word including the fruites of many other trees, for some would distinguish all sorts of fruites into *Pomum* and *Nacem*, but *Scaliger* saith the opinion of those Grammarians is too ridiculous: it is therefore usually called *Malus*, but yet that word likewise is referred to divers other kindes of trees, as *Malus Cydonia sive Cotonea*, *Malus Medica vel Citria*, *Malus Limonia*, *Malus Aurea seu Aurantia*, *Malus Persica*, *Malus Punica*, *Malus Armeniaca vel præcocia*, and many others, and *Pliny* numbreth *Zizypha* and *Tuberes* among them, who reciteth the names of a number of sorts frequent with them, as he doth every where with other sorts of fruites, which to relate here were impertinent, especially to us, who can apply but very few of them to those sorts are knowne among us, and to save time to spend to better purpose. *Cornarius* taketh the *Castiana mala* which *Columella* calleth *Sestiana*, to be the *Arantia* Orenge: but *Galen* appointing the *Castiana mala* to be boyled, to give one for the head ache, did not meane the Orenge, which was neither knowne to him or in his time, nor yet is used to be boyled. The *Arabians* call it *Tufa* and *Tufalia*, the *Italians Mele*, the *Spaniards Manfanda*, the *French Pomier* and *Pome*, the *Germanes Depffell* and *Apffell*, the *Dutch Appel*, and we Apple.

The Vertues.

Apples in generall are cold and windy, and being of sundry tastes, *Galen* sheweth thereby how to distinguish them, for some have an austere taste, and are good for fainting stomackes and loose bellyes, others sowre good to coole and quench thirst, and some sharpe, fit to cut grosse flegme, some sweete soone distributed in the body, and as quickly passed away, yet sooner corrupting in the stomacke if they be stayed: the best sorts before they be thorough ripe, are to be avoyded; then to be rosted or scalded is the best way to take them, and a little spice or seedes mixed or cast upon them, and taken after meate, doe strengthen both stomacke and bowels, especially in those that either loathe their meate or hardly digest it, and for those that are given to casting, or have a flixe or laske; those that are not sweete, but rather a little sowre or harsh, used in that manner are fittest: Sweete Apples doe loosen the belly, and thereby drive forth the wormes that are therein: sower Apples stoppe the belly, and provoke vrine; Crabs for this purpose are the fittest: The sweete Apples, as the Pippin and Pearemaine helpe to dissolve Melancholly humours, to procure mirth and expell heavinesse, and therefore are fittest for *Confectio Alkermes*, and *Syrupus de pomis*: The leaves boyled and given to drinke in hot agues, and where the heate of the liver and stomacke causeth the lippes to breake out, and the throate to grow dry harsh and furred, is very good to wash and gargle it withall, and to drinke downe some; this may to good purpose

purpose be used, when better things are not at hand, or cannot be had: the juyce of Crabs, eyther Verdjuyce or Cider is of singular good use in the heate and faintings of the stomacke, and against casting, to make a posset with some of it, and drinke, or take some thereof by it selfe: Cider is not onely called in the North Country Wine by those beyond Seas, but is used almost as wine in divers Countries of this Land where it is made, and as I said of Perry before, to a stomacke unacquainted with it, it will be somewhat troublesome thereto, and to the belly, yet by the often use of it, it becommeth familiar and helpefull to those that have fainting or weakenesse of the spirits and stomacke, somewhat comforting and refreshing the vitall Spirits; it is of great use at Sea in long voyages, and is more desired then Perry. The juyce of Crabs or Cider applyed with wet clothes therein, to scalded or burnt places, cooleth, healeth, and draweth forth the fire: a rotten Apple applyed to eyes that are blood shotten, or enflamed with heate, or that are blacke and blew about them by any stroke or fall, and bound to all day, or all night helpeth them quickely: the distilled water of rotten Apples doth coole the heate and inflammations of sores, and is good to bathe foule and creeping ulcers, and to wash the face to take away spots, freckles, or other discolourings in the face, the destilled water of good and sound Apples, is of speciall good use to procure mirth and expell melancholly; the oyntment called *Pomatum* if it be sweete and well made doth helpe the chaps in the lips or hands, or to smooth the rough skinne of the hands or face, parched with winde or other accident, to supple and make them smooth.

Chap. LXXIV.

Malus Cydonia. The Quince tree.

THere are foure or five sorts of Quinces knowne to us in these dayes, which are as followeth.

1. *Malus Cotonea vulgaris.* Our ordinary Quince tree.

The ordinaty Quince tree groweth oftentimes to the height and bignesse of a reasonable Appletree, but more usually lower and crooked, with a rough barke, spreading armes and branches farre abroad: the leaves are somewhat round and like those of the Apple tree, but thicker, harder, fuller of veines, and white on the underside, not dented at all about the edges: the flowers are large and white, sometimes dasht over with a blush: the fruite that followeth is yellow, being neere to be ripe; and covered with a white freeze or Cotton, thicke set on the younger, and growing lesse, as they grow to be thorough ripe, bunched out oftentimes in some places, some being liker an Apple, and some a Peare, of a strong heady sent, and not durable to keepe, and is sowre, harsh, and of an unpleasant taste, to eate fresh, but being scalded, rosted, baked, or preserved becommeth very pleasant.

Malus Cotonea vulgaris.
The ordinary Quince tree.

2. *Cydonia Lusitanica.*
The *Portugall* Quince.

The onely difference in this is in the fruite, which is of two sorts, the Apple Quince is great and yellow, seldome comming to be whole or seene without chapping, it is so pleasant being fresh gathered that it may be eaten like an Apple without offence, but dressed after any the wayes aforesaid, it is much more pleasant: the peare Quince is like the other, but not fit to be eaten raw like the former, but must bee prepared after some of the wayes before set downe, and so it will take up lesse Sugar then the *English*, because it is pleasant of it selfe.

3. *Cydonia Barbarica.*
The *Barbary* Quince.

This is like unto the last in goodnesse and pleasantnesse, but lesser in bignesse, not cleaving at all.

Lugdunensis. The *Lyons* Quince is a reasonable great Quince, like the *English*, but not so yellow as the *Portingall* sort.

Brunsuicensis. The *Brunswicke* Quince is almost round, neither like peare nor Apple.

The Place and Time.

The first is our *English* Quince, that best likes to grow neere ponds and water sides, and is frequent through the Land, the other have their places expressed in their titles: and flower not untill after the leaves be come forth; the fruite being ripe of the *Portugall* and *Barbary*, about the middle of *September* usually, the other later by a moneth,

The Names.

It is called in Greeke μηλέα κυδωνία, and in Latine *Malus Cydonia, a Cydone Cretæ oppido dicitur unde prima advecta* saith *Pliny* *Cato* first called it *Cotonea Malus*, and *Plinie* after him; *Dioscorides* and *Galen* have but two sorts, the one small and round, and the other greater but lesse usefull, called *Struthia*,

which

which as *Galen* saith is so called in *Asia*, *Columella* setteth downe three sorts, *Struthia* great ones, *Chrysomela* gold colour, and *Mustea* carely ones, but little. *Virgill* in his third *Eccleg.* calleth the *Chrysomela* a wild sort in these Verses.

Quod potui, sylvestri ex arbore lecta
Aurea mala decemmisi, cras altera mittam.

But *Pliny* hath erred very much in saying that the *Struthia* or *Struthiomela*, are small, contrary to *Dioscorides Galen*, and *Columella*. The *Arabians* call it *Saffargel*, the *Italians Melocotogno*, the *Spaniards Membrillio*, and *Marmello*, and from thence is our Marmelate of Quinces called *Marmelades*, the *French Coing*, and *Pomme de coing*, the *Germanes Kutten Quitzenbaum*, and the fruite *Kuttenopffel*, the *Dutch Queboom* and *Queappel*, and we Quincetree, and Quince.

The Vertues.

Quinces have a cold and earthy faculty in them, and by the reason of their great binding, they moisten the body lesse then other fruites, for they are cold in the first, and dry in the second degree: they are acceptable to the stomacke, but much more baked, rosted, or scalded then otherwise: yet when they are greene they helpe all sorts of flixes in man or woman, and chollericke laskes, castings, and whatsoever needeth astriction, more then any way prepared by fire, yet the Syrupe of the juyce, or the conserve, is somewhat conducible for much of the binding quality is consumed by the fire: if a little vinegar be added, it stirreth up the languishing appetite, and the stomacke given to casting, and if some spices it comforteth and strengthneth the decaying and fainting spirits, and helpeth the liver oppreſt, that it cannot perfect the digestion, and correcteth chollour and flegme: if you would have them purging, put honey to them in stead of Sugar, and if more laxative adde for chollour Rubarbe, for flegme Turbith, for watery humours Scamony: but if more forcibly to binde, use the unripe Quinces with Roses and *Acacia*, or *Hypocisthis*, and some torrefied Rubarbe: To take of the crude juyce of Quinces is held a preservative against the force of deadly poyson, not suffering it to have any force in the body, for it hath beene often found most certaine true, that the very smell of a Quince hath taken away all the strength of the poyson of *Elleborus albus*, which Hunters make to kill wild beasts, by dipping their Arrow heads therein: it hath beene also found certaine, that if Quinces be brought into a house where Grapes are hung up to be kept dry all the yeare, they will assuredly rot with the very smell of them: If there be neede of any outward binding and cooling of any hot fluxes, the oyle of Quinces, or the other medicines that may be made thereof, are very availeable to annoynt the belly or the other parts therewith, it likewise strengtheneth the stomacke and belly, and the sinues that are loosened by sharpe humours falling on them, and restraineth immoderate sweatings: the maccilage taken from the seeds of Quinces, boyled a little in water, is very good to coole the heate, heale the sore breasts of women, who have them sore by their childrens default or otherwise: the same also with a little Sugar is good to lenefie the harshnesse and hoarsenesse of the throate, and roughnesse of the tongue: the cotton or downe of Quinces boyled in Wine and applyed to plague sores, healeth them up, and laid as a plaister made up with waxe, it bringeth haire to them that are bald, and keepeth it from falling, if it be ready to shed.

CHAP. LXXV.

Malus Medica vel Citria. The Pomecitron tree.

ALthough diverse have used this word of *Malus Medica*, to comprehend under it all the other kindes of Lemmons and Orrenges, yet I meane to distinguish them severally, and take it but for one kinde, which as the most principall, I will set in the first place and the rest to follow, whereof there hath beene observed in divers Countries, divers varieties, and their names set downe by sundry Authours, which how they doe agree together I cannot tell, so few of them having beene seene in our Land. I will therefore here shew you those few that *Clusius* hath set downe, with some others of our owne observation

1. *Malus Citria major.* The greater Pomecitron tree.

The greater Citron tree groweth not very high, in some places but with a short crooked body, but in others not much lower then the Lemmon tree, spreading sundry great long armes and branches set with long and sharpe thornes, and faire large, and broad fresh greene leaves a little dented about the edges, with a shew of almost invisible holes in them, but lesse then the Orenge leaves have, of a very sweete sent, the flowers grow at the leaves all along the branches, being somewhat longer then those of the Orrenge, made of five thicke, whitish, purple or blush leaves with some threds in the middle, after which all the yeare long followeth fruite, for it is seldome seene without ripe fruite, and halfe ripe, and small, young and greene, and blossomes all at once: This kind beareth great and large fruite, some as great as a Muske Melon, yet others lesser, but all of them with a rugged, bunched out, and uneven yellow barke, thicker then in any of the other sorts, and with small store of sowre juyce in the middle, and somewhat great pale whitish or yellow seede with a bitter kernell lying in it, the smell of this Apple is very strong, but very comfortable to the senses.

2. *Citria malus minor sive Limonera*, The lesser Pomecitron tree.

This lesser Citron tree groweth very like the former, but the leaves are somewhat lesser and shorter, and so are the thornes also. The flowers are of a deepe blush colour, and the fruite lesser and longer then they, and no bigger then the lesser fruite of the former, the rinde also reasonable thicke and yellow, but not so rugged, having more store of sowre juyce within them, and fewer seedes.

3. *Citria malus sive Limonera prægnans.* Bigge bellyed or double Citrons.

This differeth not in the tree or any part thereof from the last, but in the fruite, which is as great as the last, and a little paler yellow on the outside, having another smaller fruite growing within it lying at the very top or head, yet not to be seene before you cut it, and is divided from the other fruite with a yellow rinde, covering the most part of it, and sticking onely to the other at the head or toppe, the greater fruite hath both juyce and seede within it, but the lesser hath no seedes, and but little or no juyce, and is more sweete then sowre: the *Spaniards* call it *Limones prennades*.

4. *Limo-*

4. *Limonera dulcis.* Sweete Limoones or Limerones.

In the fruit of this tree which the *Spaniards* as *Clusius* saith call *Limones del Emperador*, is the greatest difference from the last, which is smaller then it, but twice as big as a great Lemmon, of a deeper yellow coloured barke, and thinner by much, being full of juyce, but sweete and pleasant and may be familiarly eaten, with the rinde and all.

Malus Medica vel Citria.
The Pomecitron tree.

5. *Limonera acida.*

Sowre Limoones, or Limerones.

This sowre Limoone is very like this last, but somewhat bigger, more yellow rinded, and somewhat rugged, the juyce whereof is more sower then it, yet lesser then of a Lemmon.

6. *Limonera multiformis.*

Changeable Limoones or Limerones.

The fruite hereof is wholly neere unto a flesh colour, and of divers formes, some being of one and some of another fashion, not constant in any; the *Spaniards* call it *Limones de figuras.*

The Place and *Time.*

All these sorts of Citrons grow in *Spaine*, with those that are curious, to nourse up rare fruites, but gained from sundry places abroad; and the last from the fortunate Islands. Their time is without time, even all the yeare throughout, flowring and bearing fruite.

The Names.

The first and great Pomecitron, is called in Greeke μηλέα μηδική, that is, *Malus medica*, *Theophrastus* saith *lib.* 1. *c.* 4. that it came first from *Media* and *Persis*, and therefore was called *Malum Medicum* and *Persicum*, and some have called it *Malum Assyrium*, others *Malum Citrium* or *Citreum*, as also *Oedromela*, and *Citromela*, and *Citrangula*: some also call it *Citrus arbor*, and some *Cedrus Theophrasti & Dioscoridis*, and some *Poncires quasi Pomacitria.* And the second is called by *Clusius Limonera*, as he saith the *Spaniards* so call the tree, and the fruite *Limones*, as they doe the rest that follow, with their other severall denominations, because both tree and fruite differ from the first or true Citron, which they call *Cidras*, the *Italians Cedri*, and *Citroni*, the *French Citrons*, the *Germanes Citrinoepffel*, the *Dutch Citreen*, and *Citreenboom*, and we in *English* the Citron, or Pomecitron tree or fruite.

The Vertues.

All the parts of this fruite both the outer and inner rinde, both juyce and seed are of excellent use, and of contrary effects one unto another, as some hot and dry, others cold and dry: the outer yellow rinde is very sweete in smell, very aromaticall and bitter in taste: and dryed is a very soveraigne cordiall for the heart: and an excellent antidote against venome and poyson, against the plague or any other infection: it warmeth and comforteth a cold or windy stomacke, mightily dissolving the winde, and dispersing raw cold and undigested humours therein, or in the bowels: being chewed in the mouth it amendeth an evill breath, and causeth a good one: it also helpeth digestion, and is good against melancholly: these outer rindes being preserved with Sugar, are used as a junket, more then in any physicall manner, yet are they often used in cordiall electuaries, preservatives against infection and melancholly, and other the diseases aforesaid. It also helpeth to loosen the body, and therefore there is a solitive electuary made thereof called *Electuarium de Citro solutivum*, to evacuate the bodyes, or cold flegmaticke constitutions, and may be also safely used where choller is also mixed with flegme. The inner white rinde of the fruite is almost unsavoury and without taste, and is not used in any manner of physicke, but being preserved serveth to sort with other Suckets at banquets; the sowre juyce in the middle is cold and farre surpasseth that of Lemons in the effects, although not so sharpe in taste: it is singular good in all pestilentiall and burning feavers, to restraine the venome and infection, to suppresse the violence of choller, and hot distemper of the blood, and extinguish thirst, and correcteth the ill disposition of the Liver, stirreth up an appetite, and refresheth the overspent and fainting spirits; resisteth drunkennesse, and helpeth the turnings of the Braine by the hot vapours arising thereinto, and causing a frensie or want of sleepe: the seede is the last to be spoken of, but not of the least property, for it not onely equalleth the barke, but surpasseth it in many particulars, although *Galen* and *Avicen* seeme herein to be opposite one unto another. *Galen* maketh the seede to be cold, which *Matthiolus* would excuse with diverting his intent to the juyce; and *Avicen* saying it is hot in the first degree, and dry in the second; the barke or rinde, hot in the first, and dry in the end of the second degree, the inner white substance being betweene the outer barke and the inner juyce, hot and moist in the first degree, and the acide juyce cold and dry in the third degree: these seedes are very effectuall to preserve the heart and vitall spirits, from the poyson of the Scorpion or other venemous creatures, as also against the infection of the plague, or poxes, or any other contagious disease, they kill the wormes in the stomacke, provoke womens courses, cause an aborsement, and hath a digesting quality and a drying, fit to dry up and consume moist humours, both inwardly in the body, and outwardly in any moist or running ulcers and sores, and take away the paines that come after the biting of any venemous creature: the whole fruite or the branches of the trees laid in presses, Chests, or Wardrobes, keepeth cloath

cloath, or silke Garments from Moths and Wormes, and give them a good sent also.

CHAP. LXXVI.

Limonia Malus. The Lemmon tree.

OF Lemmons also there are divers sorts, some greater, some smaller, some with thicker, and more rugged rindes, others with smoother, some with a very sharpe and tart juyce, others with a milder.

1. *Malus Limonia acida vulgaris.* The ordinary Lemmon tree.

The Lemmon tree groweth usually great and high with great armes and slender branches armed with long greenish thornes, the leaves are long and very like unto Bay tree leaves, but dented about the edges, or like unto the Citron leaves but lesser, and full of holes like unto them also; the flowers grow after the same manner as the former, but are wholly white and as sweete: the fruite that followeth is somewhat long and round, with a paler yellow rinde then in any of those before, somewhat rugged or uneven, and not so smooth as in other sorts, and somewhat thicker also, the juyce whereof within is almost as sharpe as the next, but yet may be discerned to have the taste as it were but of an hedge fruite, and such like seede as the Citron among it, but smaller and somewhat longer, if it be heedefully marked, though they may seeme both alike.

Limonia Malus. The Lemmon tree.

2. *Malus Limonia acida cortice tenui.*
The thin rinded sower Lemmon.

There is no difference in the tree of this, from the former, nor in the fruite, but that it is a little bigger, the rinde of a fine pale yellow colour, smoother then the other, and much thinner also, wholly repleniſhed with a most delicate sharpe juyce, and the like seedes among it.

3. *Malus Limonia acida fructu rotundo.*
Round Lemmons.

The tree that beareth these Lemmons, is in all things like the last, but that it hath few or no thornes at all upon it, and the fruite having a thinne rinde like it, is somewhat rounder then it, with a small crowne at the head, the juyce within being as sower altogether.

4. *Malus Limonia dulcis major.*
The greater sweete Lemmon.

This Lemmon hath this difference from the other, that it is greater then any of the former Lemmons, the rinde yellower and smooth, and the juyce within it much more sweete and pleasant, that it may be eaten as an Orrenge.

5. *Malus Limonia dulcis minor.*
The Civill Lemmon.

This Lemmon is so like the best sort of thin rinded sower Lemmons, that it is hard by the outside to know their difference, for it is of the same size, but of a little deeper coloured rinde, and the juyce within like the last, of a pleasant tart taste, that may familiarly be eaten, or rather having but little sharpe taste in it.

6. *Malus Limonia sylvestris minima.* The last wilde Lemmon tree.

This sort of Lemmon groweth wild in *Syria* and *Egipt*. *Bellonius* maketh mention of it also, that it groweth about *Cairo*, that as he saith, are no bigger then Doves or Pigeons egges.

The Place and *Time.*

We have had all these sorts of Lemmons brought us from *Spaine* and the Iſlands at severall times, whereby we have described them unto you: and for their time it holdeth equall with the former, and the other that follow, that is, hold their leaves ever greene and beare blossomes, greene and ripe fruite all the yeare through.

The Names.

Neither the tree nor his fruite as it is likely, were knowne to the ancient Greekes or Latines, but it is in these dayes as in former times called *Malus Limonia*, and the fruite *Limones*. The *Spaniards* as *Clusius* sheweth, call the tree *Limera*, and the fruite *Limas*, all other nations follow the Latine, according to their dialect.

The Vertues.

Both the rinde and the juyce of Lemmons doe come somewhat neere unto the property of the Citron, though in a weaker degree, and in the want of the one, the other may safely be used to all the purposes before mentioned for the juyce, but the barke or rinde being thinne is seldome preserved or dryed to be used inwardly, but yet commeth somewhat neere it, if any will apply it although weaker to resist poyson, venome or infection, yet the juyce

beir-

being sharper, cooleth more, but doth not equally resist putride humours like it: an ounce and a halfe of the juyce of unripe Lemmons drunke with a little Malmesy helpeth to cleanse and expell the stone out of the kidneyes and likewise killeth and driveth forth the wormes in the body of men or children: if an angell of gold, or so much weight of pure leafe gold be set to steepe in three or foure ounces of pure juyce of Lemmons for foure and twenty houres, and then taken out, or the juyce drained cleane from it, and some of it given in a cup of Wine, with a little pouther of Angelica roote unto any infected with the Plague, and dangerously sicke, (if there be any hope or likelihood of recovery) it will helpe them, the seedes of these are likewise almost as effectuall as of the Citrons, the juyce of the sweete Lemmons is neither so cooling nor so operative for any of the purposes afore mentioned. The destilled water in glasse from the inner pulpe or substance of Lemmons cleareth the skin from all freckles, spots or other markes in the face, or in any other part of the body, provoketh urine, and breaketh and expelleth the stone being drunke, and helpeth also the running scab, and killeth lice in the head, the wormes in the hands or nose, and pusshes and wheales in the skinne. The juyce of Lemmons is singular good to use at Sea in long voyages to put into their Beverage to keepe them from the Scurvy, whereto long Sea journies are much subject; as also the more abundantly to quench their thirst in those hot climates: it is no lesse usefull at home for Dyers, who spend much of it in striking sundry dainty colours which will never be well done without it.

CHAP. LXXVII.

Malus Arantia. The Orenge tree.

I Have likewise five sorts or rather kindes of Orrenges to shew you, which are these.

1. *Malus Arantia vulgaris.* The ordinary Orrenge tree.

The grafted or ordinary manured Orrenge tree groweth often to a very great heighth and bignesse, spreading large armes and branches with a rougher barke below, and smooth greene on the branches, yet it is also often found lesse in lesse fruitefull soiles, sparingly armed with sharpe but short thornes, the leaves are somewhat like unto those of the Lemmon, but that each leafe hath a peece of a leafe set under it, and are not dented at all about the edges, and are as full of small holes in them, as any of the former, the flowers are whitish, but of a stronger sweete sent then any of the rest, and used to many other purposes then either of the other: the fruite hereof is round, with a thicke bitter rinde, of a deepe yellowish red colour, which from it taketh the name of an Orrenge colour, having a soft white loose substance, next unto the outer coloured rinde, and a sower juyce lying mixed among small skinnes in severall parts, as in the other sorts, with such like seed also: the juyce of some is lesse sower then others; and of a taste betweene sower and sweet neere unto Wine.

Malus Arantia vulgaris. The ordinary Orrenge tree.

2. *Malus Arantia sylvestris.*

The wilde or Crabbe Orrenge tree.

The Crabbe Orrenge tree (as our Crabbe Apple tree) groweth wild, and is fuller of branches, and thicker set with thornes, the flowers and leaves are alike, but lesser, and the fruite is very small, and of a pale yellow colour, with a thicke rinde and little juyce or sharpe within it, but plainely tasting as a Crabbe with us, differeth from a good fruite.

3. *Malus Arantia cortice dulci eduli.*

The Apple Orrenge.

This Orrenge differeth from others not so much in the colour of the outer barke which is of a deepe gold yellowish red, but in the whole fruite, which is through cut as firme almost as an Apricocke, and yet distinguished into parts on the inside, like others, which together with the barke or rinde is to bee eaten like an Apple, the barke or rinde not being bitter or tough like the rest: the *Spaniards* call this *Naranja axel.*

4. *Malus Arantia unico grano.*

The Orrenge without seedes.

This onely differeth from that Orrenge with the best sower juyce in having but one graine or seed in the whole juyce lying within it.

5. *Malus Arantia pumilio.*

The Dwarfe Orrenge tree.

The stocke of this dwarfe tree according to his name is low, and the branches grow thicke, well stored with leaves, but they are lesser and narrower then the other, the flowers also are many, and thicke set on the branches, which beare fruite more plentifully then the former, but is lesse then the greater sorts, yet as well coloured.

The Place and *Time.*

All these sorts likewise we have seene being brought us from *Spaine*, and *Portingall*, the hedge or wilde Crabbe

fruite

fruite from the hither parts of *Spaine*, and keepe time with the reſt.

The Names.

It is thought that theſe Apples were knowne to the auncients who called them *Mala aurea Heſperidum*, being rare any where elſe, and therefore *Hercules* made it one of his taskes or labours to ſlay the Dragon that kept the Garden where they were, and brought them away with him: Some call them *Aurantia a corticis colore aureo*, and ſome *Arantia ab Arantia oppido dicta*, ſome *Pomum Narantium*, *Dodonæus Anarantiam*, and *Lobel Malum aureum*, which name doth beſt ſuite with them for Golden Apples they are indeed: All nations call them according to the Latine, and *Cluſius* ſaith the *Spaniards* call them *Naranjas*, and the third ſort here ſet downe *Naranja caxel*, the *Germanes* call the Orrenge *Pomerants*, and the *French Pommes d' Orenges*. The flowers of the Orenge tree are called *Napha*, and the oyntment made of them *Ungnentum ex Napha*.

The Vertues.

The rinde of the Orrenges are bitterer and hotter then thoſe of Lemmons, or Citrons, and therefore doe warme a cold ſtomacke the more, helping to breake the winde therein, and the flegme, and after the bitterneſſe is taken from them by ſteeping them in water for ſundry dayes, and then preſerved either wet or dry, beſides their uſe in banquets, they are little leſſe effectuall for the ſtrengthening of the heart and ſpirits, and the other qualities that Citrons have: the juyce is farre inferiour to either of them, and are fitter for meate then medicine, yet foure or five ounces of the juyce taken at a time, will drive forth putrid humours from the inner parts by ſweat, and after ſtrengthen and comfort the heart. The deſtilled water of the flowers, beſides the odoriferous ſent it hath, fit for any perfume, it is good againſt contagious diſeaſes, and peſtilentiall feavers, to drinke thereof at ſundry times, it helpeth alſo the cold and moiſt infirmities of the mother: the oyntment that is made of the flowers is often uſed to annoint the ſtomacke to helpe the cough, and to expectorate the cold raw flegme, and to warme and comfort the other places of the bodyes.

CHAP. LXXVIII.

Malum Aſſyria vel Poma Adami. Adams Apple.

THis tree for the moſt part groweth as great as the Orrenge tree, yet ſometimes it is no higher then the Citron tree, and ſpreadeth faire great armes and branches with few, and thoſe ſhort thornes upon them, the leaves are faire and large, almoſt as great as thoſe of the Citron or Lemmon tree, pounced with holes in the like manner, the flowers alſo are not much unlike, but the fruite that followeth is more like unto an Orrenge, yet two or three times bigger, pale yellow rinded, thicke, rugged or uneven, and with ſome rifts or chaps thereon, as if it had beene bitten, (from whence was obtruded that fond opinion unto the vulgar, for wiſe men would be aſhamed of ſo ridiculous an opinion, that it was the fruite that *Adam* taſted in Paradice, and that therfore the markes ſhould remaine upon the whole kinde ever after but thus have you three or foure trees foiſted into mens conceits by irreligious cozeners, for *Adams* Apple, like to the reſt of the Rellickes in the World) a Spongy ſubſtance next to it, and with an acide ſweete juyce, yet not ſo pleaſant as others, lying in parts and round ſeedes amongſt it like the Citron, which may be eaten altogether like the Apple Orrenge as *Cluſius* ſaith.

Malum Aſſyria vel Poma Adami. Adams Apple.

The Place and *Time.*

This groweth with the other ſorts in ſundry places of *Spaine*, among the Monaſteries, or with others that are curious of rare fruites, and is in nature like the reſt, ever green, and bearing flowers and fruite all the yeare long.

The Names.

This is called by ſome *Pomum*, and *Malum Aſſyrium*, as denoting forth the place of his originall, the more generall part *Poma Adami*, yet *Cordus* in *hiſtoria*, calleth it *Citrium altera*, the *Spaniards* as *Cluſius* ſaith, call it *Toronjas*, and ſome *Zamboas*, as the *Portingals* doe, the *Italians Lomie*, and *Pomi di Adamo*, the *French Poncires* in generall.

The properties hereof are referred to the Lemmons yet having a milder juyce, and therefore not ſo much regarded as the others: it is by ſome uſed to kill the itch and take away the ſcabs, to cut one of theſe through the middle, and thereon to caſt ſome fine pouther of Brimſtone, being heated under the cinders, and rubbed on the parts affected afterwards.

CHAP. LXXIX.

Malus Punica. The Pomegarnet tree.

THe Pomegarnet tree is distinguished into the manured, bearing fruite, and into the wilde bearing none, each of these have likewise diversities in them: Of the manured fruite, there is both sower and sweete, and of a winy taste betweene sower and sweete, for so they are distinguished in the Countryes where they grow: the wilde kinde likewise is of two sorts, and both bearing double flowers, but one greater then another, but no fruite ever followeth them.

1. *Malus Punica sativa.* The Pomegarnet tree bearing fruite.

This Pomegarnet tree groweth not great in the warme Countries, and where it is naturall (and with us rising for the most part into sundry browniſh twigges) not above seven or eight foote high, spreading into many slender branches, here and there set with thornes, and with many very faire greene shining leaves like in forme and bignesse unto the leaves of large Myrtle leaves, every one upon a small reddish footestalke: among the leaves come forth here and there, the flowers which are like bell flowers, broad at the brimmes and smaller at the bottome, being one whole leafe, divided at the toppe into five parts, of an orient red crimson colour naturally, but much paler with us, and many veines running through it, with divers threds in the middle: and standing in a browniſh hollow cup, or long hard huske: the fruite is great and round with a hard smooth browniſh red rinde, not very thicke, but yellowish on the inside, and a crowne at the toppe stored plentifully with a most cleare liquor or juyce like wine, either sweete or sower, or betweene both, full of seedes, inclosed in skins, and the liquour among them: sometimes this breaketh the rinde as it groweth which will cause it to rot quickely. *Cordus in historia* maketh mention of one that hath no kernell or seed within it, and doth also mention a wild kinde to grow in *Spaine*, and *Africa*, which I cannot beleeve to be any other than that wild kinde with double flowers, which followeth next to this to be described, for he maketh that which beareth fruite to have a double flower which is not so.

Absque seminibus.

2. *Malus Punica sylvestris major sive Balaustium majus.* The greater double blossomed Pomegarnet tree.

The great wilde Pomegarnet tree with us, groweth altogether into slender browniſh branches, with some thornes among them, and shining greene leaves somewhat larger then the former, but into a shrubby low tree naturally, from the branches shoote forth flowers very double, as large as a double Province Rose, but with shorter small leaves, of an excellent bright crimson colour, tending to a silken Carnation, standing in browniſh hard cups or huskes, divided into five parts: there followeth no fruite unto these.

3. *Balaustium minus.* The lesser double Pomegarnet tree.

This smaller kinde differeth from the other but little, the leaves onely are of a sadder greene colour, the flowers smaller, and lesse thicke, and double, and of a sadder red Orrenge tawnie colour, set also in such like hard cups

Malus Punica sativa.
The manured Pomegranate tree.

Mali Punicæ sive Granatæ fructus.
The fruite or Pomegranates.

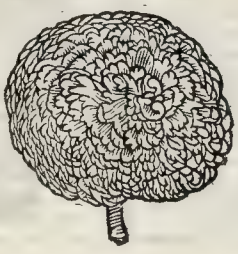
or huskes. Of one of these two double sorts, it is said that there is one that beareth white flowers, and another that hath them mixed with white and red.

Flore albo & flore v.

The Place and Time.

The manured kindes grow in *Spaine, Portugall, Italy,* and in other warme Countries, but with us preserved and housed with great care: and the wild kinde with much more: They flower very hardly with us, the first not untill *May*, and the other much later. 710.

a. *Malus Punica sylvestris sive Balaustium vastus.* The great double blossomed Pomegarnet tree.



The Names.

The Pomegarnet is called in Greeke ροιὰ and ροὰ, and by *Hippocrates* σίδα, in Latine *Malus Punica*, and *Malus Granata*, and the fruite *Malum granatum*, or *Punicum*, because it is thought that they were brought over from that part of *Africke*, where old *Carthage* stood, into that part of *Spaine*, which is now called *Granado*, and from thence called *Granatum*: The flowers of the tame kinde as *Dioscorides* saith are called *Cytini*, yet *Pliny* maketh the flowers of the wilde kinde to be called *Cytinus*, and the flowers both of tame and wilde to be *Balaustium*, but properly as I take it, *Cytinus* is the cup, wherein the flower, as well of the tame as wilde kinde doth stand, for unto their likenesse, both the flowers and seed vessels of *Asarum*, and the seede vessels of *Hyoscyamus* are resembled, and not unto the whole flower, and *Balaustium* is generally with us taken to be only the double flowers of the wilde kind: the rinde of the fruite is called in Greeke ῥοιδος and σίδιον, and so also *Psidium* and *Sidium* in Latine but generally *Malicorium* or *Cortex granatorum*: The greater double blossomed kinde is called *Balaustium Creticum* and *Cyprium*, because it groweth in both places, and the last is called *Romanum*. The *Arabians* call it *Kuman* and *Ruman*, the *Italians Melo granata*, and *Pomogranato*, the *Spaniards Granadas* and *Romanas*, the *French Grenadier* the tree, and *Pome de Grenade*, and *Migraine* the fruite, the *Germanes Granatoepffel*, the *Dutch Granaetappel*, and we in *English* Pomegranet or Pomegarnet.

The Vertues.

All the sorts of Pomegarnets breed good blood, but nourish little, and are helping to the stomacke, yet those that are sweete please best, but that they somewhat heate it and breede winde, and therefore forbidden in agues, because they breede choller: the sower doe binde, and are fit for an hot fainting stomacke, and stay casting, and provoke urine, and are somewhat offensive to the teeth and gummes, in the eating: those that are of a meane or winy taste, are indifferent to each part: the seedes within the fruite, or the rinde thereof doe binde very forcibly, either the pouther or the decoction taken, and stay casting, the bloody flixe, womens courses either red or white, the spitting of blood, and the running of the reynes; it is said also that they are good for the dropsie: the flowers worke the same effects: the fruite is good against the bitings of the Sea Hare, and the bitings of the Scorpion, and stayeth the immoderate longings of women with childe, the decoction of the rinde, or seedes of the fruite, with a little Syrope put to it, is good against Cankers in the mouth, and ulcers in the privy parts, the fundament, or any other part of the body, and is good against the rupture, it helpeth also the ulcers or running sores in the eares or nose, or rheumes in the eyes, to be dropped or injected, and fastneth loose teeth, destroyeth the flat wormes in the body, and helpeth to take away wens, or the like out-growings in the flesh: with the rinde of Pomegarnets instead of Gaules, or else with the Gaules also, is made the best sort of writing incke, exceeding the ordinary, both for blackenesse and durability.

CHAP. LXXX.

Prunus. The Plume tree.

OF Plummes there is so great variety, as I have shewed elsewhere, that it were but *actum agere* to repeate them here againe. I will therefore give you a generall description of the tree (I meane the manured kinde, for the wilde kinde which is our Blacke thorne or Sloe, is extant in another Classis of this Worke before) and that the fruite differeth in forme, colour and taste, one from another with the best properties they are serviceable unto. Vnto the Family of the Plummes belong both Apricockes, Peaches, and Nectarins, all of them being Plummes, but of severall kindes. I will therefore place the Apricocke in this Chapter as neerest to them, and the rest in the next Chapter following.

1. *Prunus vulgaris.* The ordinary Plumme tree.

The Plum tree for the most part riseth to be a great tall tree, whose body and armes are covered with a rugged barke, more or lesse, the younger branches being smooth in all: the leaves are somewhat long and broad, and rounder in most then those of Cherryes, yet differing much among themselves, some being longer, larger or rounder then others: the flowers are white and small, made of five leaves a peece: the fruite is very variable in forme, some being ovall, or Peare fashion, or Almond like, or round, in colour some being white or yellow, red, greene, or blacke: and in taste, some being soft and waterish, others firmer and not so moist, some sweete, some sower, and others of a meane taste betweene both, or harsh, or of a taste differing from all these, wherein is contained a small smooth flattish stone, with a white bitter kernell within it. Mr. *Tradescant* had a sort that bore double flowers, but perished, not long continuing with him. *Flore duplici.*

Prunus. The Plumme tree. *Armeniaca malus sive Precocia.* The Apricocke tree.

2. *Malus Armeniaca sive præcocia.* The Apricocke tree.

The Apricocke tree, if it ſtand by it ſelfe as a ſtandard tree, like other Plumme trees (which it ſeldomē doth in our Country, for that it would hardly beare fruite in that manner) will riſe to be as great as a Plumme tree, with great broad, and almoſt round leaves, but pointed at the ends and finely dented about the edges: the flowers are white and like the former but larger, the fruite that followeth is round, with a cleft or open furrow in the middle, ſomewhat like unto a Peach, of a pale yellowiſh colour on the outſide, as well as on the inſide, and a little reddiſh on a ſide in moſt, yet whiter in ſome, and of differing ſizes alſo, ſome ſmaller or greater; of a firmer or faſter cloſe ſubſtance then any of the Plummes; a ſmooth flattiſh ſtone in the middle, great or little, according to the fruite, which is ripe with, or before the earlier ſort of Plummes (and likely long before any of our earely ſorts were knowne in former times) which was the cauſe of the name, and a ſweete kernell within it, yet it is ſaid there is one that hath a bitter kernell, which I have not ſeene.

Nucleo amaro.

The Place and *Time.*

All the ſorts of them are planted, none of them growing naturally in our Country, and either in Orchards, for their private poſſeſſours, or in the Hedges, or other places of the Fields, Woods, or Parkes abroad, and flower before eyther Apple or Peare, and the Apricocke before any Plumme, by a moneth or more, and is ripe by St. *Iames* tide uſually, the other ſorts of Plummes comming on every one in their degree, ſome earlier, and ſome later.

The Names.

The Plume as it is thought is in Greeke the κοκκυμηλέα, of *Theophraſtus*, *lib.* 4. *c.* 3. and the fruite κοκκύμηλα, in Latine *Prunus* and *Prunum*, but I much doubt of it, becauſe beſide other things, not correſpondent, he ſaith the leaves doe alwayes abide on the tree. *Ingens Prunorum turba* ſaith *Pliny*, even in his time, but I thinke more then twice ſo many now. *Bellonius lib.* 2. *c.* 91. ſaith, that the *Damaſco* Plummes, that he ſaw dryed at *Damaſco*, were bigger then a Wallnut, of a firme ſubſtance, and ſweete taſte, a little tart, with a ſtone within it, rather long and flat, then thicke and round, and were deare ſold even there. The Apricocke is called μηλέα ἀρμενιάκη, πρωϊκόκκια and θερμαλέα, in Latine *Chryſomela. i. e. Mala aurea*, *Malus Armeniaca*, and *Præcocia* by all Authours, yet ſome call it *Baracocca*: The Plumme is called by the *Arabians Anas*, *Avas*, and *Hagias*, by the *Italians Prune*, and *Succine*, by the *Spaniards Prunas*, *Andrinas*, and *Amexcas*, by the *French Prunier*, and *Prunes*, by the *Germanes Pflumenboom*, by the *Dutch Pruymbonen*, and we Plummes. The Apricocke is called by the *Arabians Mex*, and *Mirmex* by the *Italians Armoniache*, *Moniache*, *Bachoce* and *Griſomele*, by the *Spaniards Albiricoques*, *Alvaricoques*, and *Albarchigas*, by the *French Abricot*, and *Carmaignoles*, by the *Germanes Sir Iohan Pfferſich*, and by us Apricocke.

The Vertues.

There is much diverſity in the faculty of Plummes, for ſome that arē ſwēete, doe moiſtēn the ſtomacke, and make

make the belly ſoluble, thoſe that are ſowre doe quench thirſt more, and binde the belly, yet they are all in ſome ſort cooling: the moiſter ſort and more wateriſh, doe ſooneſt corrupt in the ſtomacke, but the firmer doe nouriſh more, and offend leſſe taken plentifully, and thoſe are the fitteſt to be preſerved and kept all the yeare: but the dryed fruite, which are ſold at the Grocers, under the name of Damaske Prunes, doe ſomewhat looſen the belly, and being ſtewed are often uſed with the poorer ſort of people, both in health and ſickeneſſe to reliſh the mouth and ſtomacke, to procure an appetite, and a little to open the body, allay choller, and coole the ſtomacke: if a purging decoction with *Sena* Rubarbe, &c. be made for them to be ſtewed withall, it maketh them the more purging, and the more readily to be taken by thoſe that have weake ſtomackes; the leaves of the tree boyled in Wine, is good to waſh and gargle the mouth and throate, to dry the fluxe of rheume to the palate, gummes, or almonds of the throate: the gumme that commeth out of the trees, is good to breake the ſtone, and doth ſerve as a glew to faſten any thing withall: the ſaid gum or the leaves boyled in vinegar and applyed, killeth tetters, and ringwormes, The Apricocks have no uſe in Phyſicke that I know, but are wholly ſpent as a junket, eyther freſh and greene, or dryed preſerved or candid, to ſort with others, for the ſame purpoſe. Onely *Matthiolus* giveth us the uſe of the oyle, preſt out of the kernels of the ſtones, as the oyle of Almonds is made, to be good againſt the inflamed piles or hemorrhodes, the tumours or ſwellings of ulcers, the hoarſeneſſe of the voyce, the roughneſſe of the tongue and throate, and likewiſe the paines in the eares: five ounces ſaith he, of the ſaid oyle taken with one ounce of Muſcadine, driveth forth the ſtone, and helpeth the chollicke.

CHAP. LXXXI.

Malus Perſica. The Peach tree.

THe variety of Peaches is great, whereof the Nectarin is a kinde, which becauſe I have already declared them in my former Booke, I will onely here give you the deſcriptions of them in generall, and the ſpeciall uſes, as I ſaid in the laſt Chapter: but hereunto I muſt adjoyne another ſtrange tree of the Weſt Indies, which *Claſius* tooke to be the *Perſea* of *Theophraſtus*, *Dioſcorides*, *Galen*, *Pliny*, and others, which how it doth agree, you ſhall underſtand.

1. *Malus Perſica vulgaris.* The ordinary Peach tree.

The Peach tree groweth not ſo great as the Apricocke, planted either by it ſelfe, or againſt a wall, but yet ſpreadeth branches reaſonable well, from whence ſpring ſmaller reddiſh twigges, whereon are ſet long and narrow greene leaves, dented about the edges: the bloſſomes are greater then of any Plumme, and of a light purple colour, after which followeth the fruite, round, and ſometimes as great as a reaſonable Pippin, eſpecially ſome; for ſome are much ſmaller then others, as alſo differing in colours and taſtes, as ruſſet, red or yellow, wateriſh, or firme, with a frize or cotton, all over, with a cleft therein like the Apricocke, and a rugged, furrowed great ſtone

Malus Perſica. The Peach tree.

Perſea arbor. The Laurell Peach.

withia it, and a bitter kernell within the ſtone. It ſooner waxeth old and decayeth then the Apricocke by much.

Amygdalo perſicus The All. mond Peach. There is another kinde of Peach, whereof *Camerarius* and *Tauhinus* in his *Matthiolus*, and *Geſner in hortis* make mention, whoſe kernels within the rugged ſtone is not bitter as others are, but ſweete like an Almond.

2. *Nuci perſica.* The Nectarin.

The Nectarin ſeldome groweth ſo great as the Peach, the body and elder boughes being ſomewhat whitiſh, and the younger branches very red, whereon grow long leaves, very like thoſe of the Peach: the bloſſome likewiſe is reddiſh, but hath ſmaller and narrower leaves, and the fruite that followeth is as round and great as a ſmall Peach, but ſmooth on the outſide, and not rough or cottony as the Peach, nor having any cleft, of differing colours and taſtes, ſome greene, others whitiſh or yellow, and ſome red more then others, all of them of a faſt firme ſubſtance, and more delicate then the Peach, but with ſuch a rugged ſtone as the Peach and a bitter kernell within it.

3. *Perſia arbor Cluſij* The Laurell Peach.

This ſtrange tree whereof *Cluſius* onely firſt made mention, is a reaſonable great tree, ſpreading pale greene branches, and faire ſtiffe greene leaves on them like unto the large Bay leaves, grayiſh underneath and ſome croſſe veines running through them, ſweete both in ſent and taſte, but a little tipticke and biting: the flowers are like thoſe of the Bay tree, and grow many, and thicke ſet together in tufts, at the ends of the branches conſiſting of ſix pale coloured leaves a peece, after which come fruite, at the firſt greene and like a plumme, but growing ripe is long and formed like a peare, of a blacke colour and pleaſant taſte, having a long and round kernell within it, of the faſhion of an heart, and of the taſte of a Cheſnut or Almond: this abideth alwayes greene, not looſing the leaves in Winter.

The Place and *Time.*

The two firſt are familiarly nourſed up in our Orchards and gardens through the Land, but from whence is their originall I cannot ſhew you: The laſt *Cluſius* ſaith was brought forth of the Weſt Indies, and planted in a monaſtery in *Spaine*, where he ſaith he onely ſaw one tree, and none any where elſe, yet he underſtood from Doctor *Tonar* at *Sivill*, that he had ſuch another growing with him: They all flower in the Spring and fructifie in Autumne.

The Names.

The Peach is called in Greeke Περσικὰ μῆλα and ῥόδακινα alſo by ſome, in Latine *Malus Perſica*, and *Rhodacina*, but not *Dodona*, as ſome would have it, to be derived from *Duracina*, for *Doracia* is diſtinguiſhed by *Paulus Ægineta*, from *Fracocia*, and *Armenia*, and by him made all three to be better then Peaches: neither is the Greeke *Doracia*, derived from the Latines *Duracina*, but rather *è contra*. The Nectarin is called by *Matthiolus* and *Caſalpinus*, *Nuciperſica*, becauſe it reſembleth the Wallnut in the round ſmooth outer rinde, and the Peach in the meate, ſubſtance and ſtone. *Anguilara* calleth it *Perſica nux*, by the ſame intention, and *Pliny Nuci prunum*. The laſt *Cluſius* maketh the queſtion, whether it be not the *Perſea* of *Theophraſtus lib.* 4. *c.* 2. or no, which *Dioſcorides*, *Galen*, *Pliny*, and others, doe make mention of alſo, and which *Theophraſtus* deſcribeth to be a great and a faire tree, and moſt like unto the Peare tree, both in leaves flowers and branches, but that this hath an everlaſting leafe; it beareth much fruite, and is ripe at all times, the young ſtill follow the old; the fruite is of the bigneſſe of a Peare, long and like an Almond, and of a greene colour, it hath a ſtone within it, like a Plumme, but much leſſe, and of a ſofter ſubſtance, very ſweete, thus farre *Theophraſtus*. Now let me deſcant a little hereon, and compare them. Firſt, the leaves of *Perſea*, ſaith *Theophraſtus*, are moſt like unto the leafe of the Peare tree, and this ſaith *Cluſius*, is like unto the greateſt Bay leafe, the one is almoſt as broad as long, and the other twice as long as broad, beſides it is ſmall pointed, the flowers of *Perſea* are like the Peare tree, which are much larger then thoſe of the Bay, and doe not grow ſo many together as this doth, nor at the ends of the branches like this: the fruite of *Cluſius* is blace, of this greene, of that like a Peare, of this as bigge as a peare, but like an Almond, of this the ſtone is like a Plumme, of that like an Heart, which is round and not flat, as that plumme ſtone is, that hath ripe fruite onely in Autumne, this at all times of the yeare. And beſides all theſe, which are differences ſufficient to diſtinguiſh them. I doe not finde almoſt any plant, either herbe or tree growing in the Weſt Indies to be like unto thoſe that grow in *Europe*, the leſſer *Aſia*, or the hither part of *Africa*, and therefore by all probabilities, this of *Cluſius* cannot be that of *Theophraſtus*, yet this ſheweth an excellent judgement in *Cluſius* to referre this tree to that *Perſea*, but in any judgement this *Perſea* of *Theophraſtus* is moſt likely to be ſome kinde of *Myrobolane*, or elſe ſome other fruite not knowne to us. It was called ſaith *Cluſius* by them where he ſaw it, *Mamey*, but he was afterwards informed by Doctor *Tonar*, that it was not *Mamay*, but called *Aguacate*, by the Indians. Some have thought this *Perſea*, to be all one with the *Perſica arbor*, as *Palladius* calleth it, or *Malus Perſica* of *Dioſcorides*. Gaza tranſlating *Theophraſtus* in ſome places, rendereth it *Perſica*, and in others *Perſea*, as *Pliny* in one place alſo confoundeth them both together, although in another he diſtinctly ſpeaketh of *Perſea*, and ſeparateth it himſelfe from *Perſica*: but how much they differ one from another, the deſcriptions of both doth plainely declare to any: The Peach is called by the *Arabians Sauch* and *Grauch*, by the *Italians Perſiche*, by the *Spaniards Pexegos*, by the *French Peſches*, by the *Germans Pferſichbaum*, by the *Dutch Perſehoom*, and by us Peach.

The Vertues

Some are of opinion that the leaves of Peaches are of a cold quality, but *Galen* ſhēweth that the buds and leaves have an excellent bitter quality, that if they be bruiſed and laid on the belly, they will kill the wormes, and ſo will they be alſo, if they be boyled in Ale and drunke, and open the belly likewiſe, and alſo is a ſafe medicine to diſcuſe humours, being dryed; and the pouther of them ſtrewed upon freſh bleeding wounds, doth both ſtay their bleeding and cloſe them up: the flowers being ſteeped all night in a little Wine, ſtanding warme, ſtrained forth in the morning, and drunke faſting, doth gently open the belly, and move it downewards, and a Syrupe made of them by reiterate infuſions, as the Syrupe of Roſes is made is found to worke more forceably then that of Roſes, for that it provoketh vomitting, and ſpendeth wateriſh and Hydropicke humours, by the continuance the eof: the flowers condited or made into a conſerve, worketh to the ſame effect, the gumme or rather the liquour that droppeth from the tree being wounded is given in the decoction of Coltsfoote, unto thoſe that are troubled

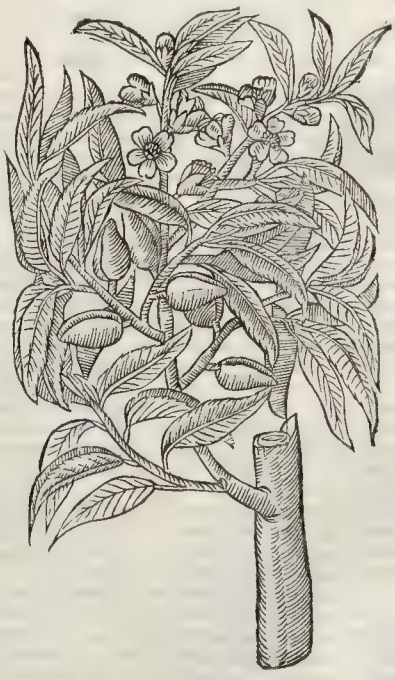
troubled with the cough or with ſhortneſſe of breath by adding thereto ſome ſweete wine, and putting ſome Saffron alſo therein, it is good for thoſe that are hoarſe, or have loſt their voyce, helpeth all the defects of the lungs and thoſe that vomit or ſpit blood. Two drammes thereof given in the juyce of Lemmons, or of Radiſh, is good for thoſe that are troubled with the ſtone it is ſaid ſome given in Plantaine or Purſlane water, ſtayeth the caſting or ſpitting of blood: the kernels of the ſtones doe wonderfully eaſe the paines and wringings of the belly, through winde or ſharpe humours, and are much commended to be effectuall to breake and drive forth the ſtone, which that they may the more powerfully worke, I commend this water unto you to drinke upon occaſion, three or foure ounces at a time. Take fifty kernels of Peach ſtones, and an hundred of the kernels of Cherry ſtones, a handfull of Elder flowers, freſh or dryed, and three pints of Muſcadine, ſet them in a cloſed pot, into a bed of Horſe dung for ten dayes, which afterwards ſtilled in glaſſe, with a gentle fire, keepe for your uſe: The milke or creame of theſe kernells being drawne forth, with ſome Verven water being applyed to the forehead and temples, doth much helpe to procure reſt and ſleepe to ſicke perſons wanting it: the oyle likewiſe drawne from the kernels doth the ſame being annointed, the ſaid oyle put into gliſters doth eaſe the paines of the chollicke proceeding from winde, and annoynted on the lower part of the belly doth the like, and dropped into the eares eaſeth the paines of them, the juyce of the leaves doth the like, killeth the wormes and ulcers in them, being alſo annoynted on the forehead and temples; it helpeth the Megrome and other paines in the head: If the kernels be bruiſed and boyled in vinegar untill they become thicke, and applyed to the head, or other places that have ſhed the haire, and are bald it doth marvellouſly procure the haire to grow againe. The Peaches themſelves being eaten, by reaſon of their ſweeteneſſe and moiſture, doe ſoone putrefie in the ſtomacke; and therefore *Galen* adviſeth that they be never taken after but before meate alwaies, ſo ſhall they make the reſt to paſſe away the more ſpeedily with them: or elſe taken after, they corrupt the reſt in the ſtomacke with themſelves. The Nectarin hath a firmer ſubſtance, and a more delectable taſte, for which it is moſt accepted, being of no uſe in Phyſicke that I know. The *Perſea* is not uſed with any.

CHAP. LXXXII.

Amygalus. The Allmond tree.

THE Almond is ſo like unto the Peach in every part thereof, and yet differing from it, that I can doe no leſſe then joyne it next, in a ſeverall Chapter, and although there are ſundry ſorts of ſweete Almonds, ſome great and ſome ſmall, others long and ſome ſhort; and a bitter kinde alſo, yet being in the whole ſurface, ſo like one unto another, that they can be diſtinguiſhed by no other thing then the Allmond, I will onely give you one deſcription, and ſhew you their differences herein, which I thinke ſhall be ſufficient. The Allmond tree groweth greater and higher then any Peach (and is therefore uſually planted by it ſelfe, and not againſt a wall, and never grafted that I have ſeene and knowne, that would take and abide, but is alwayes planted of a ſtone put into the ground, where you would have it to grow, for it hardly ſuffereth a tranſplanting) the body thereof becomming very great, whereby it ſheweth to be of long continuance, ſpreading greater armes and ſmaller branches, but brittle, with long narrow leaves on them, very like unto the Peach tree: the flowers are of a paler purple colour then the Peach bloſſomes, and not ſo bitter, and the fruite very like the Peach, for the outward forme, before it be ripe, but the outer rinde is a dry skinne without any cleft in it, or edible ſubſtance under it, as the Peach hath, and the ſhell under it is ſmooth and not rugged like it, and not ſo thicke a kernell within, being bitter in one kinde, which are ſmall like the *Barbery* Allmonds, and ſweete in all the reſt, whereof ſome are ſmall, and called *Barbery* Allmonds, others long and ſlender, and are called *Iordan* Allmonds, and others ſhort and broad, called *Valentia* Allmonds: it is obſerved that thoſe that grow in the Iſle of *Cyprus*, bend downe their heads, contrary to all in any other place.

Amygdalus. The Allmond tree.



The Place and *Time.*

They grow in all places planted, that I know, or can heare of in *Syria*, *Barbery*, *Turkie*, *Spaine*, *Italy*, and whereſoever, we have both the bitter and the ſweete of that ſort, that is, thicke and ſhort, growing in many places of our Land, and bloſſome earlier then the Peach of any ſort, and the fruite ripe alſo before them.

The Names.

It is called in Greeke ἀμυγδάλη, and the fruite ἀμυγδάλη and ἀμυγδάλον, in Latine *Amygdalus*, and the fruite *Amygdalum*, and *Amygdalinum*, ſome thinke that *Cato*

meant

meant these by the name of *Nuces Græcæ*, but yet some doe rather referre them to the Wallnuts. *Columella* maketh mention of *Nuces Græcæ*, *Iuglandes*, and *Amygdalæ*, as of three kindes, for many thinke the Almond was not knowne in *Italy* in *Cato* his time. *Pliny* out of *Theophrastus* setteth downe the way to make the bitter Almond tree to beare sweete Allmonds, and the sweete bitter: but with such fond conceits of alterations and transmutations are the workes of the ancients according to their Gentilisme too plentifully stored, which we know is contrary to the law, that God hath set in it selfe to preserve the kinde, and although there be not onely *luxus*, but *luxus naturæ*, as it hapeneth in many things, as in the Hermaphrodite, yet that altereth not the law of nature, and notwithstanding the example of the Mule. The *Arabians* call the fruite *Iauz Kauz* and *Lauzi*, the *Italians* *Mandole*, the *Spaniards Almendres*, the *French Amandes*, the *Germanes Mandelkern*, the *Dutch Amaudel*, and we in *English* Allmonds.

The Vertues.

The sweete Allmonds, are the pleasanter meate, formed into many fashions as every one liketh, but the bitter are the more physicall; the sweete are hot and moist in the first degree, the bitter are drying in the second: The sweete Allmonds blanched and dryed, that they may be made into pouther, and so taken by it selfe, or with other things helpeth to binde the loosenesse of the belly: the oyle of sweete Allmonds, mixed with the fine pouther of Sugar Candy is good for the dry cough, and for hoarsenesse, to take a little at once; the said oyle drunke either alone or with some Syrupe of Marsh Mallowes, is good for those that are troubled with the stone, to ease the paines, by opening and making slippery the passages thereof: It is used also by women in Childbed after their sore travell: being mixed with oyle of Tartar, it maketh a creame called *Lac Virginis*, that clenseth the skin, and lenyfieth the dryenesse or roughnesse, parched with the winde or otherwise: it is used also by it selfe or with other things, to annoint the stomacke for the cold: The pouther of the Allmond cakes, after the oyle is pressed from them, doth serve farre better then sope to clense the hands or skinne in any place, and to supple the parts and make them smooth: The greene fruite while they are very greene, are eaten to helpe the moist humours in the stomacke, and are eaten with pleasure by women with childe, and being preserved, are very delicate. The bitter Allmonds doe provoke urine, and womens courses, and helpe to mollifie the belly; they are good also taken with *Amylum* and Mintes, for the spitting of blood, and taken with water they are good for paines in the backe, and the inflammation in the lungs; or else taken with fine Turpintine, made into an electuary or licking medicine, with honey and milke, they are good for the obstructions of the liver, for the cough and the winde chollicke taking the quantity of a Hasell nut at a time: the oyle of bitter Almonds is effectuall to all the purposes aforesaid and doth more effectually clense the skin then that of sweete Almonds: it is also used for the noyse and deafenesse in the eares, to droppe thereof into them: the bitter Allmonds themselves beaten with oyle of Roses and Vinegar annointed on the temples, doe ease the paines in the head, and procureth sleepe and rest in hot agues, or phrensies: it doth mollefie the stiffenesse of the sinewes and joynts, and healeth the bitings of dogs and foule ulcers: if one doe eate five or sixe bitter Almonds before he fall into drinking company, it will keepe him from being overtaken more then the rest: and it is said that if they be given to a Foxe in his meate, it will kill him.

CHAP. LXXXIII.

Cerasus. The Cherry tree.

THere are as many sorts of Cherries almost as of plummes, the most whereof I have declared in my former Booke, but there are some other sorts both tall and low, that are not there mentioned, and are to be shewed in this place. And although I have there set forth, both the descriptions and figures in part of some that I doe here againe mention, both of the taller and lower sort, yet I also give you the figures of some there not set forth but described: the double repetitions being to shew the differences.

1. *Cerasus vulgaris.* The ordinary Cherry tree.

The Cherry tree riseth to a reasonable heighth and greatnesse, spreading well and somewhat thicke, the leaves are neere the plumme for forme, but somewhat longer in most, and dented about the edges: the flowers come forth two or three, or foure at the most at a place or joynt together, every one on his owne footestalke, consisting of five white leaves, with some threds in the middle, after which come round berryes, greene at the first, and red when they are through ripe, of a meane bignesse and pleasant taste, with a hard white small stone within it whose kernell is somewhat bitter, but not unpleasant. Some sorts are greater and pleasanter than others, some tart, some waterish, others firme, some red, others whiter.

2. *Cerasus Trapezuntina sive Laurocerasus.* The Bay Cherry, or Cherry Bay.

Because this tree beareth berryes very like to faire great blacke Cherryes, and a stone within them, like unto a Cherry stone; I thinke it is most worthy to be referred to this stocke or kindred of the Cherryes, howsoever formerly I set it among some kindes of Bayes. It sometimes groweth to be a faire great tree, spred into many branches, but usually with us it groweth as a shrubbe, shooting forth sundry greene branches, with goodly faire shining fresh greene leaves thereon, larger then any Bay leafe, the flowers are many and whitish, growing on a long cluster like unto the *Padus Theophrasti*, here also expressed, made of five leaves a peece, but much greater then they; after which commeth the fruite, being as large as any *Flanders*, and of a very blacke shining colour very sweete, with a round stone within them, very like unto a Cherry stone, this is taken to be the *Lotus secundus Theophrasti* by *Lugdunensis*, which may very well be.

3. *Cerasus racemosa putida Padus Theophrasti dicta.* The strange long cluster Cherry.

This tree as I said, is referred to the stocke or kindred of the Cherryes, although it doe not much resemble any of them. It groweth to be a great tree, whose body and greater branches are covered with a sad coloured barke, the younger branches being greene, whereon grow somewhat broad and short leaves, harder and more crumpled then any Cherry leafe, and dented about the edges: the flowers come forth at the joynts with the leaves in a long cluster many together, like those of *Laburnum*, the Beane Trefoile, but very small, and of a downy white

colour

1. *Cerasus vulgaris.*
The ordinary Cherry tree.

Chamacerasus Alpina repens.
The creeping dwarfe Cherry tree of the *Alpes.*

Cerasus avium racemosa.
The cluster birds Cherry tree.

Chamacerasus altera & Hungarica.
Another dwarfe Cherry, and one of *Hungary.*

Cerasus Americana sive de Baccalaos.
The Baccalaos, or new found Land Cherry.

2. *Cerasus Trapezuntina sive Laurocerasus.*
The Bay Cherry, or Cherry Bay.

3. *Cerasus racemosa putida Padus Theophrasti dicta.*
The strange long clusted Cherry.

4,5. *Machaleb Germanicum & Syriacus* The wild rocke Cherry of *Austria*, and perfuming Cherry of *Syria*.

6. Chamæcerasus montana Acaris folio.
The mountaine dwarfe Cherry.

7. Cerasus exotica rotundifolia Indica.
The ſtrange or Indian Cherrie.

colour, ſmelling ſomewhat ſtrong and ſweete, after which come the fruite, which are ſmall blacke round berryes no bigger then ſmall peaſe, with little ſubſtance upon them, and very ſmall ſtones within them, every one on a ſhort footeſtalke, but many together in a long cluſter, like the wilde cluſter or birdes Cherry, of an harſh taſte, and of an evill ſent while it is eating. The wood alſo ſmelleth ſtrong or not well, from whence came the name.

4. Machaleb Germanicum. The rocke wilde Cherry of *Auſtria*.

This riſeth ſometimes to the heighth of a reaſonable tree, on the branches whereof come forth certaine knots or knobs, and Cherry tree like leaves at them but leſſer, and from among them a ſmall long greene ſtalke, with eight or ten white flowers thereon, hanging in a cluſter, made of five leaves a peece, like unto the Cherry bloſſome with a long pointell in the middle, compaſſed with five white chives, tipt with pendents, purpliſh at the firſt, and yellow after, as ſweete as Hawthorne flowers, ſtanding in greene huskes, divided into five parts, after which come ſmall berryes no bigger then pepper cornes, and blacke on the outſide: at the ends of the branches grow ſuch like ſhining greene leaves as the other dented about the edges.

5. Machaleb Syriacum. The perfuming Cherry of *Syria*.

This *Machaleb* of the *Arabians* doth not grow to any bigneſſe, but with broad ſhort leaves like the Line tree, pointed at the ends and dented about the edges, the flowers are white, and the berryes blacke, having a ſmall ſtone within them like unto a Cherry ſtone, but leſſer, and a browniſh coted kernell within them, ſmelling hot and ſweete, yet bitter withall, which many perfumers doe uſe to mixe with other perfuming ſweetes.

6. Chamæcerasus montana Aceris folio. The mountaine dwarfe Cherry.

This dwarfe plant is reckoned alſo to the Cherryes, having broad leaves cut in or divided at the edges, reſembling thoſe of the Maple tree: the fruite is round and red like unto a Cherry, and therefore reckoned as one, two for the moſt part ſtanding together on a long ſtalke.

7. Chamæcerasus exotica rotundifolia Indica. The ſtrange or Indian Cherry.

This Exoticke Indian, hath ſtreight ſlender branches, with faire and ſomewhat broad leaves thereon, ſomewhat like unto thoſe of the Cherry tree, yet ſome rounder and not pointed at the ends, but all finely dented about the edges: the fruite is ſmall and red like a dwarfe Cherry.

The Place and *Time*.

The firſt kinde is alwayes planted in Orchards, where among divers other, it taketh up a roome. The ſecond in *Turkie*, or *Trabizond*, and planted firſt in *Italy*, at *Genoa*, in the Prince *Orias* Garden, where *Bellonius* firſt, with tedious travell found it, and was ſent from *Conſtantinople*, to *Matthiolus* and others. The third in ſome gravelly grounds in *Savoy*. The fourth, fifth and laſt, are expreſt in their titles, and the ſixth in *Lombardy*: And for the moſt part flower, and beare their fruite about the time that others of their ſort doe.

The Names.

The Cherry tree is called in Greeke κερασος, and the fruite κερασια, in Latine *Ceraſus* and *Geraſa*. *Athenæus* writeth

writeth, and so doth *Pliny*, that the Cherry was not knowne in *Italy*, before the warre with *Mithridates* King of *Pontus*, and that *Lucius Lucullus* after he had overthrowne him, brought it from *Cerasumta* in *Pontus*, into *Italy*, and gave it the name *Cerasum*, from the place he had it. The second is called by the *Turkes Trebizonda Curmasi*, that is, *Dactylus Trapezuntica*, but by *Bellonius* first, as I take it, *Laurocerasus*, and *Cerasus Trapezuntina*. *Dalechampius* tooke it to be *Lotus Africana*, but *Clusius* contesteth there-against. The third is taken by *Dalechampius* to be the *Padus* of *Theophrastus*, which *Clusius* taketh, or mistaketh rather, to be the *Cerasus avium*, or *racemosa vulgo herbariorum*, which is quite another tree, as I have shewed among the other sort of Cherryes, and *Bauhinus* followeth him therein, making them both one. The *Burgonians* about the River of *Seine*, doe call it *Pudis*, (from whence it is likely *Dalechampius* tooke the name, to come neere to *Padus*) and take it for a kinde of wilde Cherry, as the cluster Cherry is, and in the long clustering of the flowers and fruite together very like it, and because the wood smelle h strong, the *Savoyans* call it *Putier*, as also *Cerisier blanc*. *Lugdunensis* doth much confound this with the *Guajacum Pavavinum* of *Fallopius*, taking them to be all one, as also with the *Lotus secunda* of *Dioscorides*, and the *Dios pyros* of *Theophrastus*, and the *Faba Græca* of *Pliny*, without all knowledge whereof he wrote as it seemeth. It came to me out of *Italy*, by the name of *Laurus regia*, but is most usually now called *Laurocerasus*, and in *English* as it is in the title. The fourth is most likely to be the *Cerasus sylvestris* of *Tragus*, and the *Mahaleb*, or *Mucaleb* of *Clusius*, and the *Petrocerasus*, or *Chamacerasus petræa* of *Gesner*, which *Bauhinus* foulely confoundeth with *Matthiolus* his *Mahaleb*, and the *Chamacerasus Syriaca* of *Gesner*, which is the true *Mahaleb* to be both one, when as this fifth onely is the true kinde, as the sweete smelling fruite doth plainely declare, besides the diversity of the tree, as is before declared. The sixt came as a rarity from the Indies, whereof no more can as yet be said. The last is onely remembred by *Gesner* in *hortis*, and by *Lugdunensis*, who saith that *Gesner* sent a branch thereof to *Dalechampius*, by the name of *Chamacerasus montis Generosi*. The *Arabians* call the Cherry, *Sarasie*, the *Italians Ciregie*, the *Spaniards Cerezas*, and *Guindas*, the *French Cerises*, and *Guines*, the *Germanes Kirsen*, and *Kirschen*, the *Dutch Kriken*, And we in *English* Cherry.

The Vertues.

Cherryes as they are of divers tastes, so they are of divers qualities, the sweete are more lubricke, and passe through the stomacke and belly more speedily, but are of little nourishment, the tart or sowre are more pleasing to an hot stomacke, and procure an appetite to meate, and helpe to cut tough flegme, and grosse humours, but when these are dryed, they are more binding the belly then being fresh, and doe give a fine rellish to broths and drinkes wherein they are boyled; being cooling in hot diseases, and welcome to the stomacke, and provoke urine; The Gum of the Cherry tree dissolved in Wine, is good for a cold cough, and hoarsenesse of the throate: helpeth to give one a better colour in the face, sharpeneth the eye-sight, stirreth up an appetite, and helpeth to breake and expell the stone: the blacke Cherryes being bruised with the stones and distilled, the water thereof is much used to breake the stone, expell the gravell, and breake the winde: the true *Mahaleb* of *Syria*, was mistaken by *Serapio* to be the *Phyllyrea* of *Dioscorides*, when as the properties are much differing, for *Mahaleb* doth heate and mollifie, even by the testimony of *Mesues* and *Rasis*, and as *Avicen* saith, doth clense, attenuate and resolve and ease paines: The oyle drawne from the kernels, doth much more ease the paines in the bowels and backe, being annoynted, then the kernels themselves which some use for the said purpose, and for soundings, and faintings, to be taken with Mede or honyed water, and doe helpe the chollicke and stone in the kidneyes, kill the wormes in the belly, and provoke urine also.

CHAP. LXXXIV.

Cornus. The Cornell tree.

THe Cornell is divided into male and female; the male is of two sorts, one bearing red berryes like Cherries, and another whitish: the female hath no diversity.

1. *Cornus mas fructu rubro.* The male red Cornell tree.

The Cornell or Cornellian Cherry tree groweth to be a reasonable tall and great tree, the body and branches are covered with a rugged barke, and the younger smooth, whereon grow smooth leaves, and plaine, not dented at all about the edges, the flowers are many small yellow tufts, as it were short threds set together, which come forth before any leafe, and so fall away likewise, before the leaves appeare much open: the fruite are somewhat long round berries, of the bignesse of small Ollives, with a small hard stone within them, like unto an Ollive stone, reddish when they are ripe, somewhat like a Cherry, of a reasonable pleasant taste, somewhat austere withall: the wood is hard like an horne, and groweth slowly. Of this kinde *Clusius* maketh another sort, with redder berries, little differing in any thing else: and another that groweth low, but yet hath beene observed upon the transplanting to grow much greater.

Fructu magno rubro hamula.

2 *Cornus mas fructu albo.* The white male Cornell tree.

This other Cornell differeth not from the first in any other more notable matter then in the fruit, which becommeth not so red, but whitish when it is ripe.

3. *Cornus femina,* The Dogge berry or Gatten tree.

This never riseth to be a tree of any bulke or body with us (but *Clusius* saith that he saw in the Woods of *Austria*, as bigge trees hereof as of the male, and *Bellonius* saith the same *lib. 1. c. 56*) but usually abideth as an hedge bush with many pithy strong twiggy stemmes rising from the roote, of a browne colour and the sprigges more reddish, with a pith within them like unto Elder, having leaves thereon somewhat like the former, but a little shorter and broader, standing upon reddish footestalke, and the middle rib reddish likewise, the flowers are white and stand at the end of the branches, many growing together in a tuft or umbell, upon reddish footestalkes which turne into small berries, green at the first, and shining blacke when they are ripe, of a most unpleasant bitter taste provoking casting.

The Place and *Time.*

The first is found wild in many places of *Germany*, and the other sorts hereof also, but the second is more

rare

1. *Cornus mas fructu rubro.*
The male red Cornell tree.

3. *Cornus fœmina.*
The Dogge berry or Gatter tree.

rarē, the laſt growēth in every Country of the Land, ſerving for a hedge buſh; the firſt flowreth very earely, as is before ſaid, in *March*, and ſometimes in *February*, the fruitē is ripe in *Auguſt*. The laſt flowreth not untill *May*, and the fruite ripeneth not untill *September* be well over.

The Names.

The firſt is called in Greeke κρανεία in Latine *Cornus* and *mas*, to diſtinguiſh it from the other, which is called by *Theophraſtus* θηλυκρανεία *Cornus fœmina*. There is much doubt and queſtion among many of our later Writers, about this female Cornell (for of the male there is no doubt, all calling it *Cornus mas*, or *ſativa*,) whether it ſhould be the *Virga Sanguinea* of *Pliny*, or the *Hartriegell* of *Tragus*, or his *Faulbaum*, ſome referring it to the one, ſome to the other, but the generall tenet of the moſt is, that in moſt things it anſwereth both to the *Thelycrania* of *Theophraſtus*, and may well enough agree with the *Virga ſanguinea* of *Pliny*: *Cordus* calleth it *Pſeudocrania quaſi falſa Cornus*, and *Dodonæus*, beſides that he calleth it *Cornus fœmina*, taketh it to be the *Opulus Columellæ*. *Bellonius* ſaith in the 56. Chapter of his firſt Booke of Obſervations, that he found that ſhrub, which the *French* in imitation of the Latines call *des Sanguins*, and the auncient Greeke *Cornus fœmina*, betweene *Philoppos*, and *Bucephala* to be little inferiour unto our greateſt male Cornellian trees, thereby eſteeming them to be both one: The *Italians* as *Matthiolus* ſaith, call it *Sanguineo*, and *Sanguinello*, but whether it be *Tragus Hartriegel*, we are not well aſſured, for he ſaith that the wood thereof is ſo hard that it can very hardly be bored, and therefore ſerveth for many Country inſtruments, and long laſting for the hardneſſe, which we can not ſay ſo of this; we for the moſt part call it the Dogge berry tree, becauſe the berries are not fit to be eaten, or to be given to a dogge. I heare they call this in the North parts of the Land, the Gatter tree, and the berries Gatter berries, yet ſome ſay they call the *Enomymus* ſo.

The Vertues.

The male Cornell is a fruite very good and wholeſome, pleaſant with the auſterity, and helping to binde the belly ſubject or moleſted with a laske: both leaves and buds ſaith *Galen*, doe dry exceedingly, and therefore are good to ſoder up great wounds in ſtrong bodies, but not ſo fit in ſmall cuts, and more tender perſons, becauſe it dryeth too much in ſuch caſes: The Conſerve made of the fruite, is of eſpeciall uſe in all fluxes both in man and woman, the liquour that commeth out of the leaves or ſtalkes, being heated with an iron, that the iron touch them not, is good to heale tetters, and ringwormes. The Female Cornell or Dogge berry, is put to no uſe that I know, yet *Matthiolus* ſaith that the people in *Italy*, by boyling the berries, make an oyle that ſerveth for their Lampes. If one that is cured of the biting of a madde dogge, ſhall within one twelve moneth after touch the *Cornus fœmina*, or Dogge berry tree, or any part thereof, the diſeaſe will returne againe. *Sckinkins obſervation.*

CHAP. LXXXV.

Lotus: The Lote or Nettle tree.

ALthough divers Authours have publiſhed ſundry trees, under the name of *Lotus*, as *Injuba*, *Laurocerasus*, and many others, yet there is knowne unto us but one true kinde, that is called *Lotus*, the Lote or Nettle tree, yet I thinke not amiſſe to joyne two or three other plants, which may not unfitly be referred to it.

1. *Lotus ſive Celtis arbor.* The Lotē or Nettle trēe.

The true Lote or Nettle tree groweth to a great heighth, whoſe body and elder branches are covered with a ſmooth darke greene barke, the younger being more greene, whereon grow ſomewhat rough or hard leaves, long pointed, and ſomewhat deepely dented about the edges, like unto a Nettle leafe, of a darke greene colour, and often grow yellow toward Autumne: the flowers ſtand here and there ſcattered on the branches, after which come round berries like unto Cherries, hanging downewards upon long footeſtalkes greene at the firſt, whitiſh afterwards, and reddiſh when they are full ripe, but blackiſh if they be ſuffered to hang too long on the branches, of a pleaſant auſtere taſte, with an hard round ſtone within them. There is ſaid by *Theophraſtus*, if this be his firſt *Lotus*, to be another ſort without ſtones, whereof Wine was made, that would not laſt above two or three dayes.

Sine oſſi-culis.

2. *Arbor Guajacana ſive Guajacum Patavinum.* The Indian Date Plumme tree.

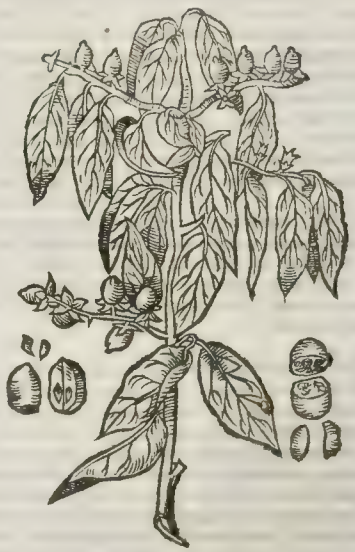
The Indian Lote tree groweth great, with a ſmooth darke greene barke, ſhooting forth many large boughes, and ſlender green branches, beſet with faire and ſomewhat broad green leaves, ſomewhat like unto the leaves of the Cornell tree, but larger, without any dents on the edges, the flowers grow along on the branches, cloſe ſet unto them, without any or with a very ſhort footeſtalke under them; conſiſting of foure greene leaves, as the huske, and foure other within, of a darke purpliſh red colour, the fruite that followeth ſtandeth in the middle of the ſaid huske, cloſing it round at the bottome, and is greene at the firſt, and very harſh, but red and round when it is ripe, and ſomewhat like a Plumme, with a ſmall point at the head, and then of a reaſonable pleaſant taſte or relliſh, wherein in the hotter climates, but ſeldome in ours or not with me, are contained thicke and flat browne griſtely ſeedes or kernels, ſomewhat like unto the kernells of *Caſſia Fiſtula*, which may be ſomewhat eaſily cut with a knife.

3. *Guajacum Patavinum anguſtifolium.* The Indian Date Plumme tree with narrow leaves.

This differeth little from the laſt, either in ſtemme or fruite, but onely in the leafe, which is longer and larger then it.

Lotus arbor.
The Nettle tree.

2. *Guajacum Patavinum.*
The Indian Date Plumme tree.



4. *Piſt unia*

3. *Guaiacum Patavinum angustioribus foliis.*
The Indian Date Plumme tree with narrower leaves.

4. *Pisshanin Virginianum.*
The Virginian Date Plumme or Pishamin.

4. *Pishamin Virginianum.* The *Virginia* Date Plumme or *Pishamin.*

This other kinde, which differeth but little from the second (if it be not all one with it, or at least a greater sort, whereof I am more then halfe perswaded, they doe so neere agree together) hath growne also with me, raised from the kernell were sent with the fruite out of *Virginia*, and grew in a short time to be of seven or eight foote high (which upon removing perished) but there groweth to be a great tree, whose wood is hard and brittle, and somewhat whitish, but covered with a thin darke green barke: the branches are many and slender, with a thinner grayish barke on them, whereon are set many faire broad greene leaves, without any dent on the edges, and very like unto the former. It hath not borne flowers or fruite in our Country that I can heare of as yet with any, but the fruite as it came to us, was in forme and bignesse like a Date, covered with a blackish skinne set in a huske of foure hard leaves very firme like a Date, and almost as sweete, with three or foure great flat thicke kernels within them, very like unto the former, but larger by the halfe.

The Place and *Time.*

The first groweth in *Italy* in divers places naturall as it is said: but in many especiall places there, and in *Provence* of *France*, and *Mompelier*, growne great trees, and so also in some places with us: The second came to me from *Italy*, by Master Doctour *John More*: and groweth now in my Garden, but came as it is said out of the West Indies, for *Daiechampius* had it from *Florence*, where they called it *Uva d'India*, and planted it about *Lyons* in *France*: The last as I said came from *Virginia*: The first flowreth earlie, and ripeneth the fruite also sooner then the last.

The Names.

The Lote tree is called in Greeke λωτὸς δένδρον, and so in Latine *Lotus arbor*, to distinguish it from all the other kindes of *Lotus herba*, which are very many. The first is the *Lotus* of *Dioscorides*, which *Pliny* calleth *Lotus Celtis*, and supposed to be the first *Lotus* of *Theophrastus*, which grew in an Island called *Lotophagia Insula*, or *Pharis*, but now called *Garbis*: as also in *Africa*, where as *Theophrastus* saith, the army of *Ophellus* passing to *Carthage*, were fed with the fruite of this tree for many dayes, they or the people where they grew most abundantly, being called *Lotophagi*, Lote eaters, whereof *Homer* also *lib. 9. Odyss.* speaketh that *Ulysses* followers so liked the sweete fruite that they could not be driven from them without blowes, to their shippes againe, (yet some referre this narration to the *Zizipha*) And is generally called *Lotus Celtis* or *arbor*, by all Writers, which *Guilandinus* saith the *Italians* call *Bagolaro*; and *Anguilara Arbor del perlaro*, and *Perlaro*. The *French Micocoulier*, and *Cacavia* by the *Candiots*, as *Bellonius* saith. *Theophrastus* and *Pliny* make mention of another sort of this *Lotus*, without stones, whereof was made a kinde of Wine, that would not endure above two or three dayes, which fruite is as yet unknowne in these dayes. The second is called *Guajacum Patavinum Fallopii* by *Gesner in hortis*, and *Lobel*, who also taketh it to be the *Lotus vera Theophrasti*, who are both in an errour, *Fallopius* that tooke it for

Guajacum, and *Lobel* that taketh it for *Lotus vera*. *Matthiolus* calleth it *Pseudolotus*, and saith that it came from *Angerius de Busbecke*, who sent it from *Constantinople* by the name of *Dactyli ex Trapesonda dulces*, but assuredly either *Busbecke* or *Matthiolus* were deceived therein, a contrary fruit being given them under that name, for the name agreeth not with his description, which is indeed the description of this *Guajacum*, for by that name of *Trabison Curmesi Dactylus ex Trapezunte*, hath the *Lauroceraſus* beene sent from *Constantinople*, as both *Camerarius* and *Clusius* doe set it downe, which is much differing from this. *Camerarius* and *Bellonius* calleth it *Guajacana*, *Cesalpinus Ermolinus*, who also taketh it to be the *Tuberum alterum genus Plinij*. *Lugdunenſis* as I said before, taketh it to be the *Diospyros* of *Theophraſtus*, *lib.3.c.13.* and the *Faba Græca* of *Pliny*. *Matthiolus* calleth the third *Lotus Africana altera*, or *Loti Afriane ſpecies*. The last hath the name in the title, as it came to us, and for the likeneſse I doe set it with them, if as I said it be not the very same: and is also likely to be the *Loti Africane altera ſpecies*, as the figure thereof plainely sheweth.

The Vertues.

The berries of the Nettle tree doe binde the belly: and the shavings of the wood made into a pouther and drunke, or boyled in Wine or water and drunke, helpeth women that are troubled with the abundance of their courses, and the laskes of the belly also: the same decoction maketh the haire to become yellow, and stayeth the falling of them. The fruite of the other while they are greene and unripe are so harsh as they are able to draw their mouthes awry that shall eate them, but when they are full ripe are reasonable sweet and pleasant: but what other property they have, I have not yet understood.

CHAP. LXXXVII.

Lentiſcus. The Masticke or Lentiske tree.

THe *Arbores reſiniferæ*, come next to be entreated of, that is, those trees that beare Rosin-like Gummes, which are divided into two sorts, that is, into those that beare berries, and those that beare Cones. The berry bearing trees are these *Oxycedrus*, the prickely Cedar, *Cedrus Lycia*, the Cypresse like Cedar, the greater and the lesser, *Sabina utraque*, both sorts of Sabine. *Iuniperas major*, the greater Iuniper tree, of all which I have before in this worke spoken, some adde *Taxus* the Yew tree, but I see no reason for it. There remaine some others to be intreated of, and the Masticke tree first, whereunto I thinke meete to joyne two other strange trees of the West Indies, which are referred hereunto for their likeneſse; the rest of them which are the Turpintine tree, the Balsame tree, the Storax tree, and the Dragon tree shall follow each in their order.

1. *Lentiſcus.* The Masticke tree.

The Masticke tree groweth like a tree, if it be suffered to grow up, and often also riseth but as a shrubbe, whose body and branches are in colour alike, that is of a reddish colour, tough and gentle: and doe somewhat bend downe their ends, whereon grow winged darke greene leaves consisting of foure couple, each of the bigneſse of the large Myrtle leafe, standing one against another, without any odde one at the end, with a reddish circle about their edges, and some reddish veines on the underside also, smelling sweete and abiding greene alwayes on the bushes, the flowers grow in clusters at the joynts with the leaves, being small, and of a pale purplish greene colour, and after in their places stand small blackish berryes, of the bigneſse of Pepper cornes, with a hard blacke shell under the outer skin, and a white kernell within, it beareth besides these berries certaine hornes, with a certaine cleare liquour in them, which turneth into small flyes, that flye away: it giveth also a cleare white gumme in small droppes, when the stockes are wounded in sundry places, which is gathered with great care and attendance.

2. *Lentiſcus Peruana.* The Indian Masticke tree.

This Indian Masticke groweth as high as any high Masticke tree, spreading long and pliant branches, bending downeward, covered with a tough reddish barke, set with long winged leaves, made of many leaves, set by couples, with an odde one at the ends, of a sad greene colour, and a white ribbe in the middle, with rugged veines transversing them, conspicuous underneath, being plaine and not dented about the edges, and being bruised have a vile sent: the flowers come forth in sparsed tufts together on a stalke, an handbredth long, consisting of five small white pointed leaves a peece, after which succeed small round berries, like those of the former Masticke tree upon short footestalkes, of the bigneſse of Pepper cornes, greene at the first, red after, and blacke being ripe, and as sharpe and hot in taste as Pepper, somewhat oylie, covered with a thin skinne, and the inward kernell of a very sharpe sent and taste. We have had a cleare white gumme in great lumpes or peeces brought us from some of our *English* plantations in the West Indies, which they called Masticke, and in the chewing was tenacious like Masticke, whether the tree from whence it was taken was answerable to this or the next, we are not certaine, because there was no relation sent thereof unto us with it.

3. *Lentiſci Peruani ſimilis Molle dicta.* The Indians Molle.

Clusius maketh mention of a tree called Molle, received from the West Indies, which as he saith might be the same with the former and differing but in age, but because there seemeth manifest difference betweene them, I thought good to sever them, and shew you it with this description that he hath given it. There rose saith he, two small plants, with the worthy Signiur *Iohn Brancion*, at *Mechlin*, from seedes that were called Molle by the West Indians, but perished by the extremity of the Winter, the third yeare after they sprang up: but the stems of them being young, were of a darke greene colour, with divers small ash-coloured spots thereon, the leaves were winged like those of the Ash, but much smaller, of a darke greene colour, dented about the edges, and the end leafe longest, yeelding a white, thicke, and glutinous sweete milke when they are broken, and being bruised smell like Fennell, having an astringent taste: it gave no flowers, but *Lobel* sheweth the flowers were yellow, but the berries that were sowne and sprung, were as bigge almost as Pepper cornes, covered with a reddish skin, and clustering together like unto a small cluster of Grapes: the gumme hereof is said to be sweete in smell.

The

1. *Lentiscus.* The Mastick tree.

2,3. *Lentiscus Peruana & Molle Clusij serratis foliis.*
The Indian Mastick tree and the Indian Molle somewhat like it.

The Place and *Time.*

The first groweth as well in *Provence* of *France* as in divers places of *Italy*, and in *Candy* also, and in many places of *Græcia*, but yeeldeth little gumme there, but especially in the Isle of *Chio*, now called *Sio*; they tend, pruine, and manure it with as great paines and care, as others doe their Vines, which goeth beyond them in the profit of the gumme: It floweth in *Aprill*, and the berryes ripen in *September*, and not at severall times, as these Verses of *Aratus* would intimate.

Jam vero semper viridis semperque gravata
Lentiscus, triplici solita est grandescere fœtu.
Ter fruges fundens, tria tempora monstrat arandi.

As it is there set downe. The second was brought from *America*, and grew, as *Banhinus* relateth it, in Cardinall *Columna* his Garden at *Rome*, where it grew great, which also as it is likely was the same that *Clusius* saith *Everardus Verstius* saw there, and as he saith likewise Doctor *Tovar* of *Sivil* in *Spaine*, sent him such like branches with the unripe fruite in clusters to see, but as he saith, called Molle by *Tovar*; *Lobel* also exhibiteth a branch hereof with the next that is dented, at the beginning of his tractate *de Balsamo*: *Clusius* himselfe also having gained a branch hereof from some place not specifyed, setteth it downe as taken from a tree growne old. The last is mentioned likewise by *Clusius* in his Annotations upon *Monardus*, to grow as all the Chronicles, or Writers of the West Indians say, in all the Vallies and Champion grounds of *Peru*, and especially *Cieza*. *Petrus de Osma* also in his Letter to *Monardus* saith it grew at *Lima* in *Peru*.

The Names,

The Mastick tree is called in Greeke σχῖνος (not σχοῖνος) which is *Iuncus odoratus*)*quasi* σχιστὸς *fissilis quod facile & frequenter in dentiscalpia findatur*, and the berries σχῖνοι and not σχοῖνοι, as some coppies have it, in Latine *Lentiscus a foliorum lentore fortasse* by which name all Authours call it, and the gumme *Resina Lentiscina*, and *Mastiche*, and *Mastix* by some, by the *Arabians Gluten Romanum*; *Dioscorides* maketh mention of a greene gumme as well as a white, and *Galen* of a blacke sort that was of *Egypt*, both which are not knowne in these dayes: in *Candy* and some other places, their trees yeeld a yellowish bitter Mastick, but no where so good, and so plentifull in all the world, as in the Isle of *Sio* in the *Egean* Sea: there is another sort of Mastick which is called *Acanthice*, or *Spinalis* as *Gaza* translateth it, because it is gathered from a prickly thistle, as I have shewed among the Thistles, in the Chapter of *Chamæleon* and *Carlina*. In former times our Apothecaries shops were furnished with no other *Xylobalsamum*, then the sprigs of *Lentiscus*, I would the errour might not be continued: The second is called Molle by *Tovar*, as I said before, and by *Clusius* in his *Cure posteriores*; but by *Banhinus Lentiscus Peruana*, and following *Clusius* saith, that it beareth the leaves according to the growth, being dented while it is young, and without dents growing older, which how dissonant me thincks this is to reason, in this plant let others judge upon my judgement, & the forme of the growing the one from the other, for the one that is

dented hath an end leafe, bigger and longer then all the reſt, which ſheweth I am perſwaded a manifeſt difference in *ſpecie*, from this that is not dented, for I cannot be perſwaded that any plant, ſhould ſo much differ in forme from it ſelfe in the time of age and youth. The laſt is alſo as I ſhewed called Molle by the Indian Writers, whoſe ſent is like Fennell, when as the other is not ſo, and is for the likeneſſe referred to the *Lentiſcus Peruana* by *Bauhinus* in his *Matthiolus*, &c. following *Cluſius* therein, to be both one, & by *Lobel* joyned with the former and the *Balſamum verum*, making it to agree with the properties therof in many things, *Baptiſta Ferrarius* alſo in his *Flora* mentioneth it by the name of *Tereanithus anguſtifolia* pag. 372. citing the third Book, and 15. Chapter of that great Book of the Weſt Indian plants, beaſts, &c. begun to be Printed more then twenty yeares ago at *Rome*, whoſe title is *Theſaurus rerum medicarum nove Hiſpane*, &c. The *Arabians* call the Lentiske tree *Darn*, the *Italians Lentiſco*, the *Spaniards Mata* and *Arveria*, the *French Lentiſque*, and thoſe of *Narbone Reſtiucle*, the *Germanes Maſtichaum*, the *Dutch Maſtickboom*, and we in *Engliſh* the Lentiske or Maſticke tree.

The Vertues.

The Lentiske tree is binding in the ſecond degree, or in the beginning of the third. and temperately hot: all the parts thereof are binding, that is, both roote and branch, both barke and leafe, both fruite and gumme, and doe binde and ſtop all fluxes, and ſpittings or caſtings of blood, and is good to ſtrengthen a weake ſtomacke, and helpe the falling downe of the mother or fundament: the decoction fomented, healeth up hollow ſores, and ſodereth broken bones, faſteneth looſe teeth, and ſtayeth creeping ſores, and doth as much as *Acacia* or *Hypociſtis*, and even the juyce of the leaves is as good a ſubſtitute for *Acacia* as any other: the oyle that is preſſed out of the berries, helpeth the itch, the leproſie and ſcabbes, both in men and beaſts: the gumme Maſticke doth binde and ſtay fluxes in like manner taken any way in pouther; or if three or foure graines be ſwallowed whole at night when you goe to bed, it not onely eaſeth all paines in the ſtomacke, but keepeth it from the like afterwards, the pouther of Maſticke with Amber and Turpinte is good againſt the running of the reines, and for both whites and reds in women: the pouther thereof mixed with Conſerve of red Roſes, helpeth to ſtay the deſtillations of thinne rheume on the lungs, cauſing a continuall cough and ſpitting of blood, and if ſome white Francumſenſe in pouther be mixed with it alſo, it worketh the more effectually, the ſame alſo comforteth the braine, procureth an appetite to meate in moiſt fluxible ſtomackes, ſtayeth caſtings, and maketh a ſweete breath: the ſame being heated in Wine, and the mouth, gummes, and teeth waſhed therewith, clenſeth and faſteneth the corruption, and looſeneſſe both of gummes and teeth: it is alſo much uſed in ſalves and plaiſters, to mundifie and heale ulcers, and ſores, to ſtay the fretting fluxes of humours to them, to dry them up, and to fill up the hollowneſſe: it ſtrengthneth and bindeth alſo the parts, whereunto it is applyed, and comforteth the aking joynts and ſinews wonderfully. The oyle that is made of Maſticke by infuſion and ebullition, *ſecundum artem Pharmaceuticam*, is ſingular good in all the aforeſaid diſeaſes, moderately comforting, mollifying and binding, and is effectuall againſt all the aforeſaid diſeaſes of the mother, againſt all paines in the belly, colon the chollick, and the ſtomacke, the hardneſſe of tumours, and the paines of the joynts and ſinewes, it likewiſe comforteth the braine, and ſtrengtheneth both the liver and heart, but one droppe of the pure Chymicall oyle drawne from Maſticke is more effectuall then one ounce of the former oyle, for it deſerveth more commendations then is given it. The effects of the Indian Molle is recorded by thoſe have written of it firſt, that of the berries, they make a wholeſome kinde of Wine or drinke being boyled with water, and according to the boyling of them either vinegar or honey: the decoction of the leaves is good to helpe cold griefes, and applyed warme to woundes after cloathes be dipped therein helpeth their cure more ſpeedily, the pouther of the barke alſo of the tree, ſtrewed or caſt into them doth clenſe, ingender fleſh, and heale them quickely and perfectly: with the decoction alſo of the barke, the ſwellings and paines of legges and thighs, are much comforted and helped; the ſaid pouther of the barke doth helpe to faſten looſe teeth, and looſe gummes, and of the wood is made fine and good toothpickes: the gumme diſſolved in milke and dropped into nhe eyes taketh away the dimneſſe or miſtineſſe of them.

CHAP. LXXXVIII.

Tere binthus. The true Turpine tree.

ALthough *Bauhinus* in his *Pinax* doth make three ſorts of Turpintine trees, taking his ground from *Rauwolfius* who maketh two ſorts beſides the ordinary one, yet I am of *Cluſius* his opinion that the greater ſort is the *Terebinthus Indica* of *Theophraſtus*, which is the Piſtake tree mentioned before, ſo that the other two ſorts we hold well to be differing Turpintines with other good Authours, and to be here deſcribed unto you: yet we doe not intend to diſtinguiſh them by *mas* and *famina*, as *Theophraſtus* doth, that the male is barren, and the female fruitefull, the one bearing red berryes which come not to ripeneſſe, and the other greene at the firſt, red afterwards, and blacke, and of the bigneſſe of a Beane when they are ripe: but *Cluſius* ſaith, that enquiring diligently thereafter, he could heare of no ſuch differences, unleſſe it may be ſaid to be a difference when ſome fruite trees bring their fruite to ripeneſſe, when others are empty or idle, by ſome caſualty or ill ſtanding: but by the leaves, the one bearing broader and the other narrower leaves.

1, *Terebinthus latifolia.* The broader leafed Turpintine tree.

This Turpintine tree in many places groweth but like a ſhrubbe, yet in ſome to be a great tree, the barke of whoſe body and greater branches, are of an aſh colour, the leſſer being greeniſh, and red while they are young, ſparingly ſet with large winged leaves like unto the Piſtacke tree but larger, every leafe being as great as a Bay leafe, and pointed, not round which putteth the difference betweene them, and ſmelling ſomewhat like a Bay, falling away, and not holding on in Winter: the flowers are moſſie like the Ollive bloſſomes, and grow on long ſtalkes comming out of certaine knots, from the ends of the branches, a number of them in ſmall tufts ſet in a cluſter together, of a purpliſh browne colour, which paſſe into ſmall berryes, ſomewhat bigger and longer then thoſe of the Maſticke tree, and very like unto the true *Carpobalſamum*, greene at the firſt, reddiſh after, and of a blewiſh colour, tending to greene when they are ripe, glutinous in handling and ſticking to their fingers that touch them, having a kernell within them: moſt of thoſe berries that grow red before they be ripe, fall away being empty,

empty and idle: this beareth alſo certaine red hollow skinny bladders, like long hornes, full of a clammy blackiſh liquour, which breed ſmall flyes or gnats in them: This being wounded in ſundry places yeeldeth forth a liquid Roſſen or cleere Turpentine, but nothing ſo thinne as that of the Larch tree.

2. *Terebinthus angustiore folio vulgatiore.*

The narrow leafed Turpintine tree.

This tree is in all things like the former, but that it never riſeth ſo high, and the leaves are long and narrow, much ſmaller then the former, the berryes are many of them red on the ſtalkes at their fall time, which declareth them to be empty huskes, and no good ſeed, and but ſome that will be full and good.

The Place and *Time.*

The Turpintine tree groweth in *Narbone*, and *Provence* in *France*, in ſundry places of *Italy*, and *Spaine*, *Cyprus* and *Greece*, where for the moſt part it abideth ſmall, and low, but groweth very great and high in *Syria*, *Arabia*, *Cilicia*, *Armenia*, and other thoſe *Levant* Countries, as *Bellonius* hath obſerved: the ſecond as *Lobel* ſaith, is much the more frequent in all the places about *Provence*: They flower ſomewhat earely in the Spring, and the fruite is ripe in *September* and *October*.

The Names.

It is called in Greeke τερμινθος, and in Latine *Terebinthus*, and the Turpintine ῥητίνη τερμινθινη, *reſina terebinthina*, the true Turpintine tree was not knowne in divers of theſe later ages before ours, for as *Matthiolus* ſaith, the liquid Roſſen of the Larch tree had by time obtained the name of Turpintine, and ſo was uſed, no man thinking that there was any truer to be had, untill the ſearch of diligent men, had brought the true Turpintine to light againe, that ſo long time had lyen hid from our Predeceſſors. The firſt is the *Terebinthus* of *Matthiolus*, *Lugdunenſis*, and others, and the *Terebinthus Lentiſci folio* of *Lobel*. The other is the *Piſtachiæ folio* of *Lobel*, and the *Terebinthus major* of others. The *Arabians* call it *Botin* and *Albotin*, the *Italians Terebinto*, the *Spaniards Cornicabra*, the *French Tereminthe*, the *Dutch Termentyn boom*, and we in *Engliſh* the Turpintine tree.

Terebinthus cum flore & cornículo.

The Turpintine tree flowring and with the horne thereof.

The Vertues

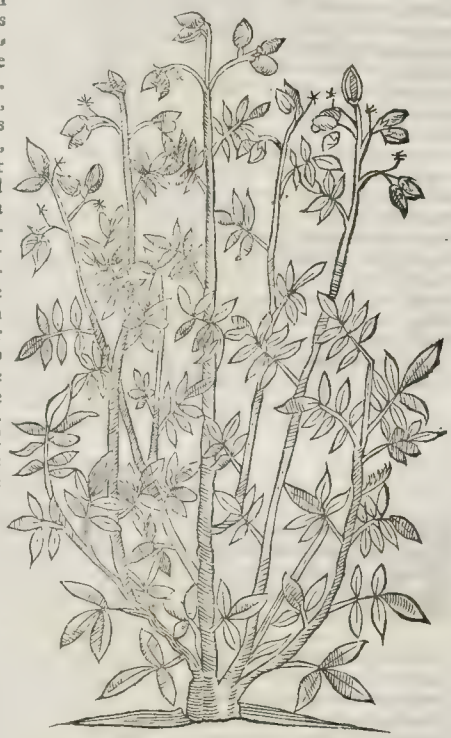
The leaves, the barke, and the fruite of the Turpintine tree are hot and dry in the ſecond degree, and doe binde, ſtrengthen, and repell, but the Turpintine doth heate, cleanſe, and purge, draweth, and mollefyeth and excelleth all other Roſſens, yet *Galen* for ſome cauſes preferreth Maſticke, that is, in binding and ſtrengthening; the berryes being dry are very neere unto the third degree of dryneſſe ſo that they provoke urine, and are good for the ſpleene, and for the biting of the Spider *Phalangium*: of the berryes is made an oyle, as out of the berryes of the Lentiſke tree, which heateth and bindeth, and is good in crampes, convulſions, hardneſſe of the ſinewes, and to cloſe wounds: the berryes themſelves are much eaten by the people in *Turkie* where they grow and make them their daily food, warming, comforting, and opening the uritory paſſages, and withall provoke luſt: the Turpintine heateth, mollefyeth, reſolveth, digeſteth and cleanſeth: if a dramme or two be taken in a reare egge it wonderfully helpeth the cough, which commeth by flegme, ſtopping the lungs, wheeſings, and ſhortneſſe of breath, and all imperfections of the cheſt by flegme: it cleanſeth the backe and reines, and ſtayeth the gonorrhæa, with a little dryed Rubarbe in pouther put thereto: it provoketh urine, and helpeth to breake and expell the ſtone and gravell, it ripeneth Impoſthumes and helpeth to expell them, and mightily diſſolveth winde in the paines of the chollicke, of the ſtomacke or ſides, and is good alſo againſt the gout, Sciatica, and all paines in the joynts, as well to take it inwardly with ſome *Chamæpitis*, Sage, and *Stœchas*, as to be made into a ſearcloath and applyed thereto: it is a ſpeciall ingredient into thoſe Balſomes that are to heale any greene wounds, and is ſingular effectuall in all wounds, and fractures in the head, all punctures in the fleſh or ſinewes, and all breakings out in the skinne, be it itch or ſcab, be they piſes, puſhes or wheales: it draweth forth ſplinters, thornes or the like out of the fleſh, and healeth the chaps of the lips, hands, fundament or other parts: briefely it is put into all ſalves, oyles, oyntments, or plaiſters, that ſerve to cleanſe ulcers, to draw and heale any ſores, or to warme and comfort any cold or weake parts: theſe things the true Turpintine performeth better then any other, which from hence hath drawne both the name and uſe: the Chymicall oyle of this Turpintine is wondrous effectuall in many of theſe diſeaſes, if it be carefully applyed, for it is by farre of more ſubtill parts, being the purer and more ſubtill ſpirits, whereby they heate and penetrate much more, and therefore inwardly or outwardly muſt be uſed in leſſer quantity, and as it were but by drops. There are in the Eaſterne Countries of *Turkie*, as *Bellonius* recordeth, much uſe made of the young hornes of the Turpintine tree, before they are growne great, for he ſaith many thouſand pounds weight of them are gathered while they are no bigger then Gaulles, to ſerve the Dyers there to dye their ſilke, which ſhall hold the colour freſher and firmer then any that is Dyed without them.

CHAP. LXXXIX.

Balsamum genuinum antiquorum. The true Balme or Balsame tree of the ancients.

TO deliver unto you this Balsame tree as I should, and as it ought and deserveth, I somewhat doubt of my ability, for who is fit for so rare, so excellent a subject, being heretofore accounted as one of the greatest jewels, and richest endowments of the earth, and as a parcell of the treasure of great Kings, and Princes, and it is thought by many that the greatest and worthyest present that the Queene of *Sheba* did or could bring and give unto King *Salomon*, was some Balsame trees, which she brought out of her Country, that *Salomon* might plant them in his: and it was also one of the greatest Iewels the first *Ptolomey* could bring away from thence into *Egypt*, as Authours doe record it: but now the times are so changed, that I thinke I shall scarce gaine credit, that the same true *Balsamum* is extant in *rerum natura*: but least my gates grow greater then my City, and so it runne out at them, let me leave any further preamble, and shew you the thing. The Balsame or Balme tree, never groweth very great, no not in the naturall places, being suffered to grow as it will, but unto five or sixe cubits high or thereabouts, and in others much lower, with divers small and straight slender branches issuing from thence, of a brownish red colour, especially the younger twigs, covered with a double barke, the red outermost, and a greene one under it, which are of a very fragrant smell, and of an aromaticall quicke taste, somewhat astringent and gummy, cleaving to the fingers, the wood under the barke being white, and as insipide as any other wood; on these branches come forth sparsedly and without order sundry stalkes of winged leaves, somewhat like unto those of the Masticke tree, consisting some but of three leaves which are those that first come forth and the lowest, others of five or seven leaves, and seldome above, which are set by couples, the lowest smallest, and the next larger, and the end one largest of all, of a pale greene colour, smelling and tasting somewhat like the barke of the branches; a little clammy also, and abiding on the bushes Winter as well as Summer: The flowers are many and small, standing by three together on small stalkes, at the ends of the branches made of six small white leaves a peece, which are succeeded by small browniish hard berries, little bigger then Iuniper berryes, small at both ends, crested on the sides and very like unto the berryes of the Turpintine tree, of a very sharpe sent, having a yellow hony like substance within them somewhat bitter, but aromaticall in taste, and biting on the tongue like the *Opobalsamum*: From the body hereof being wounded, commeth forth a liquour (and sometimes a little of it selfe without scarifying) of a troubled whitish colour at the first, which after some small time groweth cleare, being somewhat thicker then oyle in Summer, of so sharpe a piercing sent, that it will pierce the nostrils of them that smell thereunto, like unto oyle of spike almost, but as it groweth in age, so it decayeth both in the thinnesse of the substance growing thicker, and in the smell nothing so quicke, and in the colour becomming yellow like hony, or browne thicke Turpintine, as it groweth older.

Balsamum genuinum antiquorum.
The true Balme or *Balsamum* tree of the ancients.



The Place and Time.

Arabia felix about *Mecha*, and *Medina*, and a small village neere them called *Bedrunia*, with the hils, vallies, and sandy grounds about them. and the Country of the *Sabeans* next it, are thought by many to be the onely naturall places, where this tree hath beene ever knowne in these or the former dayes to grow, and from thence hath *Iudea* and *Egypt* ever beene furnished, whatsoever hath growne therein as *Alpinus* relateth; but it is somewhat probable to me, that the hils of *Gilead* did nourish this tree long before the Queene of *Sheba* brought any as it is thought to *Salomon*, in that the *Ishmalites* that bought *Ioseph* of his Brethren, as it is set downe *Gen.* 37. *v.* 24. are said to carry from *Gilead*, Balme &c. downe to *Egipt*, and *Gen.* 43. 11. *Jacob* willeth his Sonnes to carry to *Ioseph* in *Egipt*, some of the best fruites of the Land, *sc.* Rossin &c. which I take to be understood this Balme, or else Rossin simply might be thought too simple a present for *Ioseph*, and not one of the best fruites of the Country: but I doubt of the truth of that tale that the Queene of *Sheba* did first bring the Balsame trees to *Salomon*, and that he planted them in the valley by *Iericho*, but rather that they were fetched from the hils of *Gilead*, and planted by him there in Orchards, the better to be tended. *Ieremy* the Prophet doth also often mention the Balme of *Gilead*. And yearely pruined both by the *Iewes* and *Arabians*, to have the greater store of liquor. It flowreth in the Spring with the Turpintine tree, and fructifyeth with it in the Autumne.

The Names.

From the *Arabians* who call it *Baleſſan*, have the Greekes called it βαλσάμον, and the Latines *Balsamum*: the liquour

liquour they call ὀποβάλσαμον *Opobalſamum*, or βαλσαμηλαιον *Balſameleon*, and the berryes or fruite of the tree καρποβάλσαμον *Carpobalſamum*, and ξυλοβάλσαμον *Xylobalſamum*. Divers of the auncient Writers have made mention of this tree, but ſo diverſly that many do thinke they wrote of a thing that was not, or that was not ſeene and knowne unto them, at the leaſt the deſcriptions are ſo lame and ſeeme ſo to vary one from another, yet if they be warily and wiſely conſidered, they may be brought in ſome ſort to agree thereunto, but for me to argue much in this matter, and the particulars would require a great deale of time and roome, which cannot be ſpared here, I muſt referre them to *Alpinus* and *Belloniꝰ*, that would be further ſatiſfied herein, who have more largely entreated of this ſubject.

The Vertues.

This Balſame tree ſaith *Galen*, is hot and dry in the ſecond degree, ſo that it is ſweete in ſmell being of thinne parts: but the liquor or *Opobalſamum*, is of more thinne parts then the plant it ſelfe: the fruite or berryes is very like it in quality, but farre inferiour thereunto in the ſubtility: The liquour or *Opobalſamum*, is of great good uſe againſt all poyſons and infections, both Vipers, Serpents and Scorpions, the peſtilence and ſpotted fevers, and all other putride and intermiſſive agues that riſe from obſtructions, and crude cold humours, to take a ſcruple or two in ſome drinke for ſome dayes together, and to ſweate thereon, for this openeth the obſtructions of the liver and ſpleene, and digeſteth thoſe raw humours in them, cheriſhing the vitall ſpirits, radicall moiſture, and naturall heate in them and is very effectuall in all cold griefes and diſeaſes of the head or ſtomacke, helping the ſwimmings and turnings of the braine, weake memories, and the falling ſickneſſe: it cleareth the eyes of filmes or skinnes, overgrowing the ſight, and eaſeth the paine in the eares, and their deafeneſſe and other diſeaſes, to be dropped into the eyes or eares, it helpeth the cough, ſhortneſſe of breath, and conſumption of the lungs, by warming and drying up the diſtillations of rheume upon them, and all other diſeaſes of the ſtomacke proceeding of cold or winde, the cold or windy diſtempers alſo of the bowells, wombe or mother, procuring torments and paines, or the colde moiſtures procuring barrenneſſe, procureth the courſes, delivereth the dead birth and after birth: the fluxe alſo of the whites and the ſtopping of urine: it cleanſeth alſo the reines and kidneyes, and freeth them from the generation of ſtones in them, and expelleth the gravell or ſtones in them: it is ſingular good againſt the palſie, crampe, tremblings, convulſions or ſhrinking of ſinewes, and for greene wounds, the moſt ſpeedy operatour of any: from the ſingular effect whereof all other medicines made for the health of the body or to heale wounds were called *Balſamum*, Balme. The women in *Egypt*, herewith as *Alpinus* ſheweth, preſerve their beauty, and young forme for a long time. the berryes are eſpeciall good againſt poyſons and infections, the falling ſickneſſe, the ſwimmings and paines in the head, the cough, and diſeaſes of the lungs, the windy paines and ſtiches in the ſides, the reſtraint of urine, and the riſing of the mother and other diſeaſes thereof to ſit in a bathe made of them: the wood worketh the ſame effects but in a farre weaker manner.

CHAP. XC.

Styrax arbor. The ſweete Storax tree.

BEſides the Storax tree, that hath uſually been knowne and deſcribed by allmoſt all Writers of Herbs; and which I am now about to ſhew you, *Bauhinus* from *Honorius Bellus* in *Candy*, hath exhibited another ſort, whereof he is ſo briefe, that little more can be aſſured thereof by his relation, then the name, and the confidence of his judgement from whom he had it, that it may be referred hereunto. A third ſort is the *Storax rubra*. whereof we have leſſe knowledge then of the laſt.

1. *Styrax arbor vulgaris.* The uſuall Storax tree.

This Storax tree groweth very like unto the Quince tree, both for forme and bigneſſe, the leaves alſo are long and round, and ſomewhat like but farre leſſe, whitiſh underneath and ſtiffe. The flowers ſtand both at the joynts with the leaves, and at the ends of the branches, conſiſting of five or ſixe large whitiſh leaves, like unto thoſe of the Orrenge tree, with ſome threds in the middle, after which come round berries, ſet in the cups that the flowers ſtood in before, of the bigneſſe of Haſell nuts, pointed at the ends, and hoary all over, each ſtanding on a long footeſtalke, containing within them certaine kernels in ſmall ſhells: this yeeldeth a moſt fragrant ſweete gum, and cleare, of the colour of browne hony, if we might have it ſincere without mixture, which yet wee in ſmall drops have had.

2. *Styrax folio Aceris.* A Storax with Maple leaves.

From a round blackiſh rugged roote covered with a creſted, or as it were joynted barke come forth out of knots three or five broad leaves like unto thoſe of the Maple or Plane tree, ſtanding on ſmall blackiſh long ſtalkes, and are divided in three or five parts, full of veines dented about the edges, and pointed at the ends.

3. *Storax rubra.* Red Storax.

This thing that formerly was called *Storax rubra*, was a barke of ſomē kind of tree, and thought to be the *Naſcaphthum*, or *Naſcaphtum* of *Dioſcorides*, but *Cordus* on *Dioſcorides* ſcanning the matter ſomewhat more ſeriouſly determineth it to be a thing utterly unknowne to him in his time, and by the cheapeneſſe of that barke that went under that name, ſaith plainely it was too cheape to be right, *Dioſcorides* making *Naſcaphthum*, to be like the barke of the Sycomore tree, as ſome coppies have it, or the Mulberry tree as others and brought from *India*, being of a ſweete or pleaſant ſent in fumigations as well by it ſelfe as mixt with other perfumes: but *Matthiolus* taketh *Naſcaphthum*, to be that which was called *Tigname* in ſhops, which as he ſaith the *Italians* called *Agallocho*, that is *Lignum Aloes*, and ſo *Cordus* alſo ſaith, that one *Iohannes Rodericus* a *Portugall* tooke the *Naſcaphthum* to be that which in their ſhops was called *Palo daguilla Lignum Aquilæ*, that is the ſame with *Lignum Aloes*, as aforeſaid, but *Cordus* miſliketh that opinion, the *Lignum Aloes* being a wood and the *Naſcaphthum* a barke; yet although this long diſcourſe be ſomewhat from the matter in hand, yet ſeeing it fell ſo fitly to ſpeake of *Naſcaphthum*, I could not doe otherwiſe then ſhew you what others have thought thereof, in that as I ſaid divers tooke it to be *Storax rubra*, when as no auncient Authour mentioneth it: but both *Serapio* and *Avicen* divide *Styrax* into *liquida* and *ſicca*, by *liquida* underſtanding the pure gumme flowing from the tree, and not that *liquida*

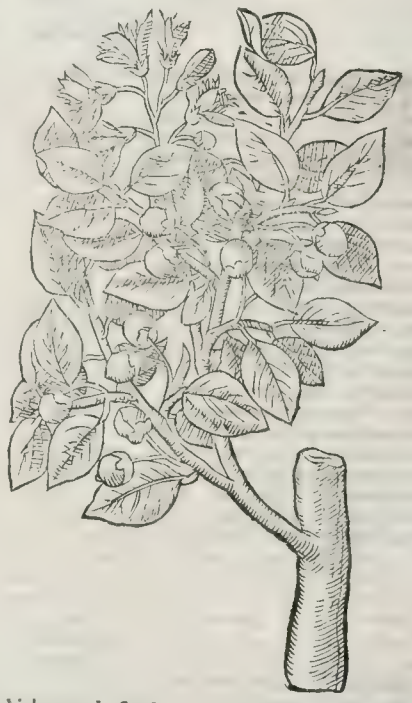
which

which we have now adaies by that name, and by the *fæces*, the *faces* of the expressed oyle from the fruite, but some of our modernes take the *Calumita* to be *Rubra*.

The Place and Time.

The first groweth in *Provence*, of *France* in *Italy*, *Candy*, *Greece*, and other these hither parts of *Turkie*, where it yeelds no gumme, but in *Syria*, *Cilicia*, *Pamphilia*, *Cyprus*, and other of those hotter Countries, it giveth much, but is so adulterated that I thinke scarse none in our age hath seene any sincere come over unto us, as by that sincere stuff, that which we have drawn out of the best gumme we could get, is plainely to be discerned, so much grosse *faces* remaining behind, after the expression, and by the comparing of it with *Dioscorides* his notes: It flowreth in the Spring, yeelding fruite in *September*, the other *Bauhinus* as I said, had it from *Bellus* of *Candy*, but where it grew is not signifyed.

Styrax arbor vulgaris. The Storax tree.



The Names.

It is called in Grecke στύραξ, and in Latine *Styrax arbor*, as the Gumme is called *Gummi Styrax*, or *Storax*, and in shoppes *Storax* or *Styrax Calamita*, which for what cause it was so called, *Galen* declareth, that because the best and most sincere came from *Pamphilia*, they used to put it into Canes, the better to preserve, not onely the sent as most say, but even the substance too, as I thinke, for the pure sincere gumme is so piersing that no barrell can be made so close, but that it will search the joynts, and draine through them, which opinion of mine although it may seeme strange, as not being heard of before, yet I have many reasons both to induce me therunto, & some to contrary theirs that object the transportation of handfuls of *Dictamus*, in Canes or Ferula stalks in the like manner, which are of far differing natures: the one a dryed herb, which needed not any such inclosure, to preserve the sent, whereof it hath not so much that they needed so to put it up for feare of loosing, and besids the cask was so smal that abundance of them could containe but a little merchandize, some other cause they had surely, if they did put them, the leaves and stalkes I meane, into the Canes (whereof I somewhat doubt, but that they put them rather with Canes to keep them from breaking) & this other a gum that required some tight cask to containe it, for feare of leaking, and the Cane between the joynts, as not having any chinke, was the fittest with them I thinke to containe it, and thereof I thinke came the name of *Calamita*, to confirme which opinion, I have found the sincere gumme of Storax, which I have by Art and the presse onely (and not by any distillation) purified and made to be so pure that it would pierce even through a wooden vessell in the heate of Summer, and therefore was forced to keepe the said sincere gumme in a glasse or gally pot, which was so fluent that it would runne upon any small occasion of leaning downe the vessell a long time after the extracting. There is some doubt also with many, what that *Storax liquida* should be, for none of the ancients have made mention of any such thing: some would have it a kinde of *Storax* from the tree, and to that purpose *Durante* hath figured out a Storax tree, appropriating the *Storax liquida*, to issue from thence, which is besides the text, and more then he can prove: others from the *Arabians* I thinke, take it to be the extraction of pure fat Myrrhe, called *Myrrhe stacte*, which I cannot see how it should be so, seeing the *Storax liquida*, is of so strong and piercing a sent that no Myrrhe, from whence they say it should be taken hath any the like: it is therefore assuredly some other thing whereof as yet we have not attained the knowledge, *Bauhinus* lastly in describing this *Styrax folio Aceris*, in his *Prodromus* entituleth it *Styrax liquida*, which how much or little it forteth thereunto, I know not, the time hereafter may declare. The *Storax rubra* something hath beene spoken thereof here before, yet some travailers have affirmed that the tree thereof groweth in *Cyprus*, but (unlesse they meane the first Storax tree) untill it be further confirmed, I shall rest doubtfull thereof.

The Vertues.

There is no part of this tree in use with us, but the gumme that issueth out of it, and it is hot in the second degree, and dry in the first. It heateth, mollefyeth and digesteth, and is good for coughes, catarrhes, destillations of rheumes and hoarsenesse: it provoketh womens courses, and mollefieth the hardnesse and contractions of the Mother, it gently looseneth the belly, if a little of the true Turpintine be put unto it, and so made into pilles and taken: it resisteth those poysons that kill with coldnesse, as the Hemlocke doth, and the like: a small quantity thereof taken saith *Pliny*, doth drive away sadnesse from the minde, but if it be taken too much or too often, it doth contrarily bring and encrease it, and worketh paine and heavinesse in the braine, and cause troublesome sleepes. Used as a pessary it draweth downe mightily, both the courses and the afterbirth, dropped into the eares, it taketh away the singings and noyse in them, applyed to the hippes, shoulders or joynts afflicted with cold aches it resolveth and comforteth much, and is good to be put into the bathing are made for lamenesse in the joynts, and wearinesse by travaile, it is also of good use to be put with white francumsence, to persume those that have catarrhes, theumes and desluxions from the head into the nose, eyes or other parts, by casting it on quicke coales and holding their heades over the smoke, and to aire their night caps therewith, wherein they meane to lie: it

dissolveth

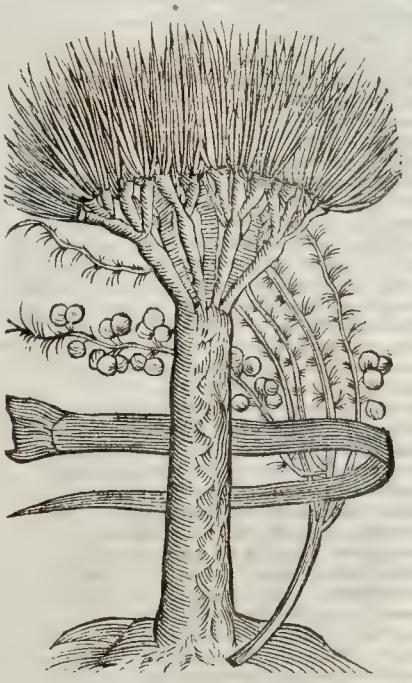
diſſolveth hard tumours in any part, as thoſe about the throate called the Kings Evill, and other nodes or tumours in the fleſh or on the joynts: It ſerveth alſo as a perfume to burne in houſes or chambers, either alone or with other things, it is put alſo among ſweete pouthers in bagges, for cheſts and wardrobes.

CHAP. XCI.

Draco arbor. The Dragon tree.

Muſt needes adde this tree to the reſt of the berry bearing Reſinous trees, becauſe it agreeth with them, whoſe deſcription is on this manner. It is a goodly faire great tree to behold, riſing as high as a Pine tree, with a great body, covered with a rugged barke, full of chappes and clifts, bearing eight or nine great armes, equally ſpreading from the toppe of the truncke or body thereof, each of them bare, for a cubits length, and then thruſting forth at their heads three or foure ſmaller branches, yet of an armes thickeneſſe, and bare alſo for a certaine ſpace, and bearing at the toppes of each of them, divers very long and narrow leaves joyned together at the bottome, and compaſſing one another like as the Flowerdeluces doe, each of them being a cubit in length, and an inch in breadth, growing narrower to the end, where it is pointed with a thicke middle rib, running through the middle, all the length of them, and being reddiſh about the edges, which are ſharpe like the *Iris* leaves, abiding alwayes greene: from among the leaves at the heads, come forth long footeſtalkes, of about a footes length, branched forth into other leſſer ſtalkes, bearing at certaine ſpaces, divers fruites or berryes in cluſters (for the flowers have not beene obſerved) each of them like unto a ſmall Cherry, of a ſowriſh or tart taſte, and of a yellowiſh colour, when they are ripe with a ſtone within them, very like a Cherry ſtone, and a like kernell alſo (but here is no ſhew of any Dragon here in to be ſeene, as *Monardus* tableth, and others that from him have ſet it forth, which ſheweth how neceſſary it is to have judicious and conſcionable men to be the firſt relators of ſtrange or unknowne things) out of this tree being ſlit or bored, commeth forth a thicke (not cleare as *Matthiolus* ſaith) darke red gumme or Roſſin, which hardneth quickely, and will melt at the fire, and flame being caſt therein, yet ſomewhat dryly, being bruiſed it ſheweth a very orient red crimſon or bloody colour, yet is very hardly mixed with any liquour, eyther water or oyle: the wood is very hard and firme, and hardly admitteth to bee cut: but the younger branches are more tender. What if Maſter *Hamonds* fleſh tree, growing in *Magadaſcar*, ſet forth in his Paradox, yeelding liquor like blood, may not prove to be this tree, if the tenderneſſe of the wood, cutting as he ſaith like fleſh, either hinder not the identity, or be not an hyperbole.

Draco arbor. The Dragon tree.



The Place and Time.

This tree groweth in the Iſlands both of *Madera*, and the *Canaries*, and in *Braſſill* alſo, as I am given to underſtand, where it groweth vaſt, but *Cluſius* ſaith that he found it in the Orchard, belonging to the Monaſtery of our Lady of grace in *Spaine*, planted among ſome Ollive trees on a ſmall hill: the Time is not expreſſed. This is ſo tender, that although it hath ſprung with us from the ſtones that were ſet, yet it would ſcarſe endure to the end of Summer, but periſhed with the firſt cold nights.

The Names.

It is moſt probable that neither *Dioſcorides* nor any of the ancient Greeke or Latine Authours had any knowledge of this tree, or could give any deſcription thereof, but of the gum or Roſſin onely, yet neither knew whether it came from herbe or tree, or was a minerall of the earth, but called it κιννάβαρις in Greeke, and thereafter *Cinnabaris* in Latine, *Dioſcorides* ſaith that it was ſo ſcarſe to be had, that the Painters could not get ſufficient for their workes, but yet ſaith ſome called it *Sanguis draconis*, ſo ancient is the name, and by which onely the moderne Writers are led to thinke that the gumme of this tree continuing the name to this day, the reſt of this declaration agreeing likewiſe thereunto, is the right *Cinnabaris* of *Dioſcorides*: but *Pliny* in his 33. Booke and 7. Chapter, for the elder world hath fabled (no leſſe then *Monardus* from his Biſhop of *Carthage* in this as is aforeſaid) and ſet it downe for a truth that *Cinnabaris*, is no other thing but the blood of a Dragon or Serpent cruſht to death by the weight of the dying Elephant killed by him, and that both their bloods mingled togethers, was the *Sanguis draconis* that the Painters uſed, and was alſo uſed in medicines. *Iulius Solinus* alſo affirmeth the ſame thing: but aſſuredly the true cauſe of the name hereof was the bloody colour that the gum gave, however they coloured the truth from others knowledge by the name of a Dragon.

The Vertues.

There is no part of this tree put to any uſe in Phyſicke with any that I know, but the gum onely, yet no doubt in

in the naturall places, or where it groweth, both barke and fruite might be applyed for such like diseases as the gumme is put unto, which is very astringent, serving to restraine the fluxe of blood or humours, from any parts both in man and woman, as laskes, the menstrues whites, and the gonorrhea: it is also said to helpe the strangury and stoppings of the urine, to fasten loose teeth, and is very availeable for the gummes are spongy or with loose flesh: it is good also to stay the watering of the eyes, and to helpe those places that are burnt with fire: The Goldsmiths and Glasiers use it much in their workes, the one for an enamell, and to set a foile under their pretious stones, for their greater luster; and the other by fire to strike a crimson colour into glasse, for Windowes or the like. I doe not know that Painters can bring it to be a fit colour to be used in their workes.

CHAP. XCII.

Cedrus magna Conifera Libani. The great Cedar of *Libanus*.

THe rest of the *Arbores resiniferæ*, those trees that beare Rossins are to follow, which are these that beare Cones, being the great Cedar, the Pine tree, and all the sorts thereof both tame and wild, the Pitch tree, the Firre tree, the Larch tree, the Cypresse, and the *Arbor vitæ*, or tree of life: and first of the great Cedar. This great Cedar groweth up with a great thicke upright body, taller then any other tree whatsoever stored with branches on all sides, but so ordered that the lower branches spread largest, and still upward they grow smaller up to the toppe, representiug the forme of a Pyramid or Sugar loafe, to them that view it a farre of; the greater and lowest branches with the body are somewhat rugged and full of chappes, but that of the upper branches is very smooth, and of an ash colour, and being rubbed away with ones nailes, appeareth greene underneath, and reddish under that: the branches some say grow all upright, but others straight out, and as it were crosse wise, strong, but brittle, and easie to be broken, not to be bended and so placed about the body, one above another that they yeeld an easie ascent up to the toppe, as it were by steps: the leaves grow many together, out of a knot, which are small long and narrow, like unto those of the Larch tree, somewhat hard, but not sharpe at the end as they are, and so set, the longest being in the middle, and the lesser on the sides, that they represent the forme of a Painters pensell, abiding alwayes greene on the trees, being somewhat sweete in sent, a little sowre, bitter and astringent in taste: it beareth Cones that grow upright like as the Firre doth, not hanging downe as others doe, slenderer then those of the Pitch tree, and thicker, greater, and harder then those of the Firre, somewhat yellowish and round at the end, made of many scales, with a short foote-stalke to it, but so firmely set to the branch, that without breaking away some of the wood of the branch, it cannot be pulled away, yet the scales opening of themselves, will fall away, leaving the stalke bare that went through the middle of them, but this it will not doe untill the next yeare after it be ripe, for it requireth one whole yeare to ripen, within which is the seede, as bigge as Grape kernells, somewhat sweete in taste, bedewed with an oylie substance, that is of a good sent: out of this tree there commeth two sort of Rossin called *Cedria*, the one thinne like unto that of the Firre tree, which commeth forth by piercing the tree at the sundry knots while they be young and not covered with a rugged barke, and putting thereto an horne, out of which it must runne: the other Rossin floweth forth of it owne accord, growing hard of it selfe thereon, which will sticke so fast to the teeth if it be chawed, that it will hardly be pulled away againe, and being smelled unto giveth a very sweete sent; the Wood is durable above all other, and not in many ages yeelding to corruption.

Cedrus magna Conifera Libani.
The great Cedar of *Libanus*.

The Place and Time.

This Cedar groweth on sundry mountaines in *Syria*, and the parts neere thereunto, and the coldest parts of them that are covered with snow as *Amanus*, *Taurus* and *Libanus*, and not in many places else that have beene observed, the time is declared in the description to be a whole yeare in perfecting the fruite, and as *Pliny* saith, new come forth before the old are ripe.

The Names.

This Cedar is called in Greeke κέδρος (not knowne to *Dioscorides*, *Galen* or *Pliny*, as their workes testifie, for theirs is the *Oxycedrus*, that beareth berries like to Iuniper, or the Mirtle) and κέδρελαι *quasi Cedrabies*, because it groweth high, like the Firre, *Theophrastus* calleth it κέδρος φοινικὴ *Cedrus Phœnicea*, which *Gaza* unfitly translateth *Punica*, and in the *Geoponickes Dendrolibanus*, *Cedria* you have heard before what it is, namely Rossin that floweth out of the tree, when it is bored or peirced, as in the Firre and other trees: but *Cedrium*, which some call

Cedrelaum

Cedrelæum or *Cedreoleum* is the first liquid substance that commeth out of the sticks, while they are in the burning (such as we call tarre, that is, the liquour of the Pine and Pitch tree sticks when they burne) before the hard Pitch commeth forth, with which as well as with the *Cedria*, in former times the *Egiptians* embalmed the bodies of the dead, to cause them to abide for ever uncorrupted: but many Writers confound these and the Pitch of the Cedar together, that issueth out in the burning after the first, calling them *Cedria*, when as they are divers. The *Arabians* call the tree *Serbin*, (and the Rossin or Tarre *Kitran Alkitran*; and *Ketran*) the *Italians Codro*, the *Spaniards Cedro*, the *French Cedre*, and we Cedar.

The Vertues.

There is no part of this tree put to any Physicall use, but the *Cedria*, or Rossin that commeth out of it which is hot in the fourth degree, and preserveth the dead bodies from rotting, and therefore was called the life of the dead, and the death of the living, because if it be laid on garments or skins, it will burne and consume them: yea and to the tender flesh of the living, it will worke like a cauliche: yet is it effectuall to cleare the sight from filmes or skinnes that are growne over it, and taketh away the scarres of wounds and sores, and mixed with a little vinegar and dropped into the eares, it killeth the wormes, and with the decoction of Hyssope, being put in taketh away the noyse and humming in them, if a little of it be put into an hollow tooth it easeth the paines, and breaketh the tooth, if it be mixed with a little vinegar, and they washed therewith it will doe the like: it helpeth the disease of the throate called the Quinsie, and killeth both nits and lice: it resisteth the poyson of the Sea Hare taken in sodden Wine, and if it be laid with salt on the biting of the venemous serpent called *Cerastes*, it will helpe it: it helpeth the leprosie also, if it be either annointed or taken inwardly, and purgeth the ulcers of the lungs, and healeth them if a small quantity thereof be taken: it also helpeth the itch and scabs in man or beast, it killeth the living childe in the mothers body, and expelleth the dead, and taketh away all hope of conception if the privy parts be touched therewith.

CHAP. XCIII.

Larix. The Larch tree.

THe Larch tree groweth oftentimes as high as either the Pine or Firre tree, but most usually lower, covered with a very thicke barke, rugged and full of chappe, and reddish on the inside, the branches grow one above another, in a comely order, having divers small yellowish knobs or bunches set at severall distances, from whence doe yearely shoote forth many small thicke long and narrow, soft and smooth greene leaves, as it were in a tuft together, like the former Cedar, but shorter, smaller and blunter pointed then the leaves of either Pine or Firre tree, which doe not abide any Winter as they doe, but fall away as other trees that shed their leaves, and gaine fresh every Spring (which is peculier to this alone, among all the other kindes of Rossin-bearing trees) the blossomes are very beautifull and delectable, being of an excellent fine crimson colour, and very sweete, which afterwards turne into small soft cones, like unto Cypresse nuts while they are close, but longer then they, made of many fine and thin small scales, one lying upon another, standing on a short stalke, having small seede on the inside of every scale, formed like a small Bird, with two wings, and a small sweete kernell within them like the Pine kernell: the wood is very firme, hard, and close, long in growing and long lasting, and maketh the best coales for all Smiths worke, and for Miners to melt the Ore of mettall, above any other wood to hold fire longest and strongest, although *Pliny* saith, *lib.* 16. *c.* 10. that it burneth no other wise then a stone, nor maketh any coales, which how it can bee, that a Rossinous tree should not burne any may judge: it yeeldeth forth a liquid Rossin being bored, very cleare and white, which we call *Venice* Turpintine: there is also found upon the bodies, and greater boughes hereof, a kinde of hard and dry Mushrome, called *Agaricke*, whereof I have spoken with the Turpintine of this tree, in the second Classis of this Booke, which is of purging Plants.

Larix. The Larch tree.

The Place and *Time.*

It groweth not in all *Greece*, for neither *Dioscorides* nor *Theophrastus*, hath made any mention thereof, but most plentifully in the Woods by *Trent*, and in all that tract betweene *Germany*, and *Italy*, and many other places of *Germany*, it shooteth forth as is said young leaves every Spring, with the blossomes presently after, and ripeneth the fruite before Winter.

The Names.

It is called in Greeke λάριξ, and the Turpintine ῥητίνη λαρικίνη, in Latine also *Larix*, and the liquid Rossin *Resina Laricea*, or *Larigna*, or *Terebinthina Venetia*, *Pliny* faulted many times in mistaking the *vinus Picea* of *Theophrastus* for this, applying those things to the *La-*

rix, which he doth to *Picea*, as *Lugdunenſis* ſheweth very amply. *Vitruvius* alſo erred with *Pliny*, in ſaying that the wood of the Larch tree did burne no otherwiſe then a ſtone in the fire: that *Fuchſius* alſo was in an errour: *Matthiolus* ſheweth, that thought the *Venice* Turpintine was taken from the Firre tree, for he proteſteth that upon his owne knowledge and ſight, it came from the Larch tree, he alſo inſiſteth againſt *Braſavolus*, that thought other trees had produced *Agaricke*: but thoſe of other trees were hard Muſhromes, ſuch as we call Touchwood, which ſerveth like tinder to receive fire ſtrucke from the flint, &c. all Authours call it in Latine *Larix*, the *Italians* and *Spaniards Larice*, the *French Meleſe*, the *Germanes Lerchenbaum*, and we the Larch tree.

The Vertues.

I have ſpoken ſo ſufficiently of both Turpintine and Agaricke, in the ſecond Claſſis of this Worke, that I can adde nothing more thereto, and therefore to prevent a double repetition of the ſame things, I muſt referre you thereunto.

CHAP. XCIIII.

Pinus. The Pine tree.

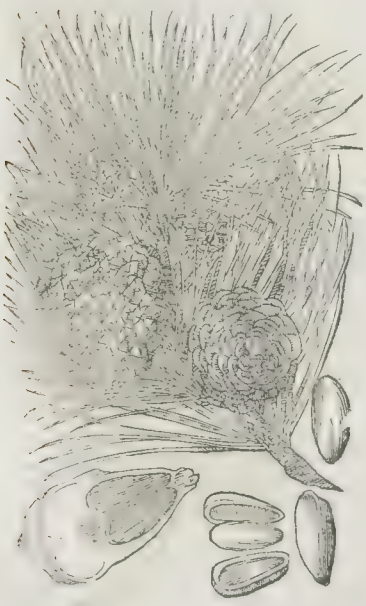
THere are many ſotts of Pines, ſome tame ſome wild: of the tame kinde there is obſerved little variety: but of the wild much, for ſome grow on mountaines farre diſtant from the Sea, others on the hills and places neere the ſea, of all which, although they be many, I would make but one Chapter, and not ſeparate them into any more

1. *Pinus urbana ſive domeſtica.* The manured Pine tree.

The tame Pine tree groweth very great and high, with a thicke re[illegible] coloured barke, ſpreading large armes towards the toppe, [illegible] ſide unto another, whereon are ſet by couples together a joynt or knot all along the ſame, ſhe me unto another. Long ſtrow or a[illegible] ſtand hard and ſtrong, pale greene leaves, abiding continually on the young branches, and not falling away but from the elder: this beareth three ſmall yellow catkins in the Winter, which fall away in the Spring as the cones encreaſe: the fruite or cones, that are ſomewhat long and round, grow very high on the branches, and are ſomewhat greater then in any of the other ſorts, compoſed of ſundry hard and browne wooddy ſcales, lying cloſe one unto and upon another, which when they open of themſelves, or are cauſed by the heate of the fire, doe ſhew within them certaine hard ſhels, which containe in each of them, a long and whit every ſweete kernell, covered with a very thin reddiſh skinne, that is eaſily rubbed off; the wood hereof is firmer, heavier and cloſer grained then of the Firre or Deale, reddiſh alſo, and not ſo ſhort or brittle as it is, and with a kinde of moiſture about the heart. This is not ſo plentifull in yeelding either Roſſin or Pitch, if it ſhould be ſo ordered as the wilde kindes.

1. [illegible] *ſativa.*
[illegible]

2. *Pinus ſylveſtris montana fructu ſera.*
[illegible]



Of

3. *Pinus ſylveſtris altera fructifera Teda arbor ſorte.* The ſoft ſheld wilde Pine tree.

4. *Pinus ſylveſtris humilis infructifera.* The low wild barren Pine tree.

Of this kinde ſome make another ſort, whoſe conē or apple is ſomewhat longer.

Altera conis oblongioribus.

2. *Pinus ſylveſtris montana fructifera.* The fruiteſull wilde Pine tree.

This wild Pine groweth ſeldome ſo high, but very like unto the former tame kinde, being no otherwiſe to be diſtinguiſhed from it, but that it groweth of it owne accord upon hills and mountaines, and that the barke thereof is thicker and rounder, and the leaves ſomewhat ſhorter, harder, more prickly, and of a ſadder greene colour, and the cones or fruite ſmaller, but have as good and ſweete a kernell within them as the former, and contained in as hard a ſhell.

3. *Pinus ſylveſtris altera fructifera Teda arbor ſorte.* The ſoft ſheld wild Pine tree.

This other wild Pine groweth great in ſize, and large in body, but yet not of that height as the other, neither is the barke reddiſh nor ſo thicke, but darker and pliable: the leaves alſo are like, but grow thicker on the branches, even foure or five at a knot or joynt, and the tree fuller of branches, but more crooked and full of ſappe, and end in a penſill-like forme: the cones are ſmall and ſhort, not much bigger then thoſe of the Pitch tree, of a darke purpliſh colour, full of Roſſin, but ſofter, and the ſhels within them eaſie to be broken betweene ones fingers, the kernells likewiſe being very tender and ſhort, and ſweete, like unto thoſe of the tame Pine, but a little harſher, as the taſte of moſt wilde fruites are, in compariſon of the manured. This kinde doth more frequently corrupt with the abundance of the ſappe, which is the Roſſin, then almoſt any other ſort.

4. *Pinus ſylveſtris humilis infructifera.* The low wild barren Pine tree.

This wilde Pine tree riſeth up with little or no body at all, but ſhooteth forth very long armes round about, like unto pipes, from whence peradventure it was named *Tubulus* being ten, and ſometimes fifteene cubits long, whereof ſome call it alſo *repens*, being ſlender and without knots, or branches, of which are made hoopes to binde caskes, becauſe they are ſo ſmooth and ſo flexible: the cones are not bigger then the laſt, but have no kernels within them that may be eaten, and therefore called *infructifera*, barren or fruitleſſe, and not becauſe it beareth not cones or fruite.

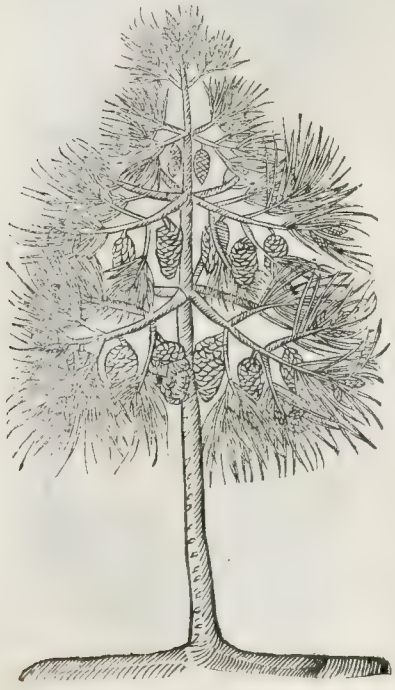
5. *Pinus ſylveſtris ſterilis elatior.* The taller barren wilde Pine tree.

This tree hath a ſingle blackiſh roote, that ſhooteth downe into the ground like a ſtalke, the body whereof is often crooked and writhen, covered with a reddiſh barke, but the branches are ſmooth, and eaſie to be broken, being thicke buſhing at the toppe, the leaves are ſlender and hard, and but two at a knot or joynt, ſomewhat writhed at their firſt ſpringing, and taſting harſh and ſomewhat ſower: the cones are but ſmall and without any edible kernells like as the laſt is.

6. *Pinus maritima major fructifera.* The greater Sea Pine tree.

This greater Sea Pine riſeth to a meane height, with a crooked body, and for the moſt part ſpreading into branches from the ground, the leaves are ſomewhat long, and like the firſt wilde kinde, but ſhorter and greener, the cones are ſomewhat leſſer, longer, and whiter, with much Roſſin often on them, the kernels whereof are like unto them, but covered with a blacke skin. *Cluſius* hath ſet forth another ſort hereof, whoſe figure I here give you.

6. *Pinus maritima major fructifera.*
The greater Sea Pine tree.



6. *Pinus maritima major fructifera altera Clusij.*
Another sort of the greater Sea Pine tree of *Clusius*.

7. *Pinaster maritimus minor.*
The lesser or dwarfe Sea Pine tree.

8. *Pinaster pumilus montanus.*
The dwarfe mountaine Pine tree.

7. *Pinus maritima minor.* The lesser or dwarfe Sea Pine tree.

The lesser Sea Pine scarse riseth to the height of a man, full of more slender and pliant branches then the former, not covered with so rugged a barke, nor spreading so much, the leaves are very slender, shorter and not so hard: the Cones are likewise lesser and slenderer, and so are the kernels also, and covered with a blacke skinne.

8. *Pinaster pumilio montanus.* The dwarfe mountaine Pine tree.

This dwarfe Pine riseth to a mans height, branching forth from the ground into somewhat large armes, and covered with a thicke rugged barke, spreading about: the leaves stand by couples, as in divers of the other sorts but thicker shorter and blunter pointed, and of a sadder greene then in the first wild kinde, the cones are small little above an inch long, not much bigger then the Larch tree cones, but more round at the head, and smaller at the end, standing upright, and not hanging downe as all the others, the shell of the nut within is winged as many are, but the kernell is small and hard.

9. *Pinaster tenuifolius julo purpurascente.* The crooked mountaine Pine with thin leaves.

The body and branches hereof are crooked or writhed and not streight, the leaves thereon are very thinne, and shorter then many others, two joyned together, round about the branches, at the ends whereof come forth certaine small scaly catkins of a purplish colour which fall away into a small pouther, and after them come in the middle a new sprout of leaves, inclosed in a certaine skin: the cones hereof are small and blunt pointed.

10. *Pinaster niger latiore folio julis pallescentibus.* The crooked mountaine Pine with broader leaves.

This other crooked Pine hath such a like body and branches as the last, spreading much, and with a sadder barke, the leaves are broader also, sharper pointed and shorter then they, and of a darker greene colour: the catkins comming forth at the ends of the branches like the last, are of a yellowish greene colour, and not purple as they are, after which come new leaves in the like manner: the cones are smaller then they.

The Place and Time.

The first tame kinde is found planted in sundry places of divers Countries, for the beauty of the tree with his ever greene leaves, yet are they found also wild about *Ravenna* towards the Sea side. The other sorts grow both in *Spaine*, *Italy*, and *Germany*, and the parts neere adjoyning, and the Sea kindes neere the Sea, in many places and upon the Land also as *Clusius* hath observed: the catkins of many come forth in the Winter, and fall away in the Spring: others spring not untill *May*, the fruite of some of them being ripe in the end of Autumne and others, not of a yeare after the springing.

The Names.

The Pine tree is called in Greeke πεύκη, in Latine *Pinus*, the Cones are called κῶνοι, in Latine *Coni*, and the auncienter Greekes σφαῖραι, but now the kernels are so called, the kernels within them πιτύδες, *Pityides*, as *Dioscorides* saith, who calleth both those of the Pine and of the Pitch tree by that name, whereof *Matthiolus* is in some doubt that the place is erronius, the word Pitch tree being thrust into the Text without any ground of reason: for πιτύδες are τῶν πίτυων καρποὶ, as σφαῖραι be τοῦ πεύκου *Pinorum fructus*; and the kernells onely of the Pine tree are edible, and not the Pitch tree. That πεύκη which *Theophrastus*, *Dioscorides*, and *Galen* sheweth, should be the Pine tree, and not the Pitch tree, may be shewed in divers places out of *Galen* and others, although *Pliny* doth mistake them, from the likenesse of *Peuce* to *Picea*, and *Pitys* to *Pinus*, as also *Peuce* to *Larix*; and *Belonius* from him doth so also, and *Gaza* sometimes translateth them right, and sometimes wrong, but there may be as much doubt, what tree *Dioscorider*, and *Theophrastus* meant by πίτυς, whether the Pitch as it is thought by the most judicious or some sort of Pine, because *Dioscorides* putteth them both together in the title of the Chapter, as if they were both of one kinde, and yet saith some held them to be divers sorts, and nameth the fruite of them both by one name as is shewed here before, when as it is plainely knowne to all that have observed them, that the Pitch tree doth more resemble the Firre then the Pine, as being no other difference betweene them, the Pitch and the Firre, then betweene male and female, as I shall shew you after a while, and there is greater difference betweene the Pitch and the Pine tree, then there is of the Pines among themselves: and *Theophrastus* also in many places of his Bookes nameth πίτυς ἀγρία, as if there should be two sorts of Pitch trees, a tame and a wild, which is not found in him to be so distinguished, as he doth of the Pine: I know to mend this matter, that *Lugdunensis* sheweth the reading of πίτυς ἀγρία, to be understood *picea aquifolium*, two words in his judgement, but how those two words should be so often joyned together in him, I see not unlesse they were meant one thing. *Matthiolus*, findeth much fault with *Pliny*, that maketh *Teda* his sixth kinde of Pine tree, taxing him for errour for it, for that *Theophrastus* and others make *Teda* to be but the peculiar fault or corruption of the Pine tree of what kinde soever, that is suffocated and killed with the abundance of it owne fatnesse, not suffering the sappe to rise that should nourish it, and then serveth for lights as Torches, slived out into shivers, the cause whereof *Theophrastus* sheweth *lib. 6. caus. cap. 15.* as he did *lib. 3 hist. c. 10.* what *Teda* is, but other good Authours shew that although *Teda*, be so taken with *Theophrastus* and others, yet that letteth not, but that there might be also a tree peculiar that bore the name of *Teda*, it being *homonomia*, a word of divers significations, and that else *Pliny* was not in his right senses, to appoint it a peculiar kinde, and knew it was appropriated to corrupt trees also, as himselfe declareth in many places of his Bookes. The first here set downe is called *Pinus urbana, domestica, sativa*, and *vulgatissima* by all Authours that have written thereof. The second is called *Pinus sylvestris fructifera*, or *montana*, or *Pinaster* likewise by all Authours. The third is the *Pinus sylvestris Cembro* of *Matthiolus*, which *Lugdunensis* calleth *Teda arbor Plinij*, as he maketh the computation, and his *Pinus Tarentina* also. The fourth is *Matthiolus* his *Mugo*, and the *Pinus tubulus Plinij* also of *Lugdunensis*. The fifth is the *Pinus sylvestris sterilis* of *Lugdunensis*, but is not the *Pinus maritima Theophrasti* of *Lobel*, nor the *maritima major* of *Lugdunensis*, for these are the next or sixt, that is *Pinus maritima major*, although *Bauhinus* putteth them all under one title, and the other of this kinde, is another sort thereof that *Clusius* hath set forth. The seventh is the *Pinus maritima minor* of *Dodonæus*, and *Bauhinus*, and the third *Hispanicus* of *Clusius*. The eighth is *Clusius* his *Pinaster pumilio*. The ninth his *Pinaster tertius Austriacus*. And the last is his *Pinaster secundus Austriacus alter* or *niger*. The *Arabians* call the Pine *Senabar*, the *Italians* and *Spaniards Pino*, the *French Pin*, and the kernells *Pignons*, the *Germanes Hartzbaum*, and *Fichtembaum*, and *Pijnholtz*, the *Dutch Pinappelboom*, and Wee the Pine tree, or Pine Apple tree.

The Vertues.

The barke of the Pine tree is binding and drying, ſtaying the laskē and provoking urine: it helpeth the frettings and gallings of the skin, ulcers alſo that poſſeſſe the upper parts, and burnings with fire, taken with *Ceratum Myrtinum*, or with *Litharge*, and skinneth them after, and mixed with Coperas, it ſtayeth the fretting or creeping of ulcers, the fumes thereof taken underneath, cauſeth a delivery of the birth, and expelleth the ſecondine: the leaves are cooling and aſſwage inflammations, and keepe ulcers from being inflamed, a dramme of them taken in water or mede, that is honyed water, are good for the heate of the Liver; if they be boyled in vinegar, and gargled warme in the mouth, it helpeth the paines in the teeth and gummes, the like doth the ſhivers of the Torchpine boyled in vinegar and gargled. The kernells of the Apples are wholeſome, and much nouriſhing while they are freſh, and although they be ſomewhat hard of digeſtion, yet they doe not offend, eſpecially if they be ſteeped three or foure houres in warme water, before the taking, to ſoake out their ſharpeneſſe and oylineſſe: thoſe that are of hot conſtitutions may take them with Sugar, but thoſe that are cold with hony, and ſo they doe amend the putrefying humours in the ſtomacke and bowels, and ſtir up bodily luſt and encreaſe ſperme, if they be made into an electuary with a little pouther of *penidij pennits*, and ſome ſweete wine, alſo they much helpe an hoarſe throate, wheeſings and ſhortneſſe of breath, and when the voyce is loſt, and expectorate flegme, and are good for an old cough, and the ulcers of the lungs: they alſo lenifie the uritory paſſages being fretted with the ſtone, and cauſe them to be eaſily avoyded: they helpe alſo to ripen inward Impoſtumes, and are ſingular good for macilent bodies, to hearten them and make them grow fat, being often taken they helpe the paſſie, ſhaking, and numneſſe of the members. Both Comfitmakers, and Cookes know how to make dainty *Quec choſes* for their delight that will have them. There is a water deſtilled from the greene cones or apples that is very effectuall to take away the wrinckles in the face, to abate the over ſwelling breaſts of Maides, by bathing them with wet cloathes in the water laid on them, and to reſtore ſuch as are raviſht into better termes.

Chap. CXV.

Picea. The Pitch tree.

THe Pitch tree hath formerly beene comprehended under one kinde, yet *Pliny* ſeemeth to reckon a *ſativa* and a *ſylveſtris*, the *ſativa* to be *Sapinus*, and the *ſylveſtris Picea*: but we in theſe times knew but one ſort until *Cluſius* hath added a dwarfe ſort thereunto.

1. *Picea vulgaris.* The ordinary Pitch tree.

The Pitch tree is ſo like unto the Firre tree that it oftentimes deceiveth them that are not skilfull

Picea. The Pitch tree.

2. *Picea pumila.* The dwarfe Pitch tree.

or

or well exercised therein, for it is to be discerned but by some especiall notes. It riseth up as high and groweth as great as the Firre, steeple fashion, with a thicke reddish ashcoloured barke, rough and tough like leather, and spreadeth the branches a crosse as that doth, but bending downe, not standing upright as the Firre doth: The leaves also are thicke set on all sides of the branches, and not onely on two as the Firre: being thicke and short, round, and not flat as the Firre leaves are, softer also and not hard, pointed at the ends like it: the cones come forth at the ends of the branches, after the catkins are fallen, which are some what reddish at the first springing forth, and being full growne are slender, about seven or eight inches long, bending downewards, abiding so long on the trees, untill the scales opening, the seed within them which is small and blackish, falleth out upon the ground, the wood is smoother, softer, lesse knotty, and with fairer and straighter graines, and thereby more accepted in workes then the Firre, from this tree is gathered small peeces of white hard dry Rossin, distilling out thereof of it owne accord, very like unto *Olibanum*, that many may be deceived with it, as also a liquid Rossin or Turpintine, by boring the tree as others are, and Pitch also, as from the Pine.

2. *Picea pumila*. The dwarfe Pitch tree.

This tree never riseth high, but alwayes abideth low, spreading the branches in manner of a crosse as the former, beset with shorter and paler greene leaves all about them, this beareth certaine small heads, of the bignesse of an Hasell nut, composed of scales laid close one upon another, whose end is a prickly leafe, which opening when it is ripe sheweth it to be like hollow voyd or empty places within, and from the heads that are at the ends of the branches, shoote forth oftentimes branches with sundry short and prickely leaves: whether it bore either flowers or fruite, *Clusius* saith he knew not, for he saw none on any that he found.

The Place and *Time*.

The first groweth usually in all Countries with the Firre trees, but seldome neere the Sea: the other *Clusius* found in his search for simples in *Germany*, but nameth no place: The Pitch tree blossomes fall away in *March* and *Aprill*, when the cones begin to come forth, which are ripe before Winter, but abide on as is said, if they be not gathered, untill it shed all the seede, and that the windes and the weather have rotted and blowne downe the stalkes of the withered.

The Names.

It is called in Greeke πίτυς, and in Latine *Picea*: because the pitch is made of this tree yet, as all Authours doe agree, the Pine tree is most usually taken for that purpose, and of it is made both the best and the most store. *Bellonius* as *Clusius* thinketh was much deceived in the Pitch tree, taking the wilde Pine tree for it, in his second Booke and third Chapter, where *Clusius* noteth it, giveth it the figure of his Pitch tree, which is the wilde Pine tree as he saith, but *Bellonius* in his first Booke and 44. Chapter, doth there give the figure of the *Sapinus*, which he saith some *French* men call *du Sapin*, and some *de la Suiffe*, which as *Lugdunensis* saith, is the name by which they call the Pitch tree, so that it seemeth probable that *Clusius* hath herein mistaken *Bellonius*, yet he saith in the said second Booke and third Chapter, that the Inhabitants doe take *Teda*, Torches from this tree, and that they make pitch, and *Cedria*, Tarre from it also, which is most usually made of the wilde pine tree, but if pitch were not made of this tree, it had the name of pitch tree given it in vaine: πιτυοκάμπαι *Pityocampæ*, are taken to be called *Eruca pinorum*, when as they onely grow on this tree. The *Arabians* call it *Arz*, but *Tragus* saith, they call the Pine tree by that name also, the *Italians Pezzo*, the *Spaniards Pino negro*, the *French Pesse* and *Soiffe*, the *Germanes* have no other distinct name then *Thannenbaum* to call it by, by which also they call the Firre tree, onely they call it *Schwartz oder rot Thannenbaum*, which *Tragus* calleth *Abies rubra*, and thinketh it to be *Picea*, the *Dutch Peckboom*, and we Pitch tree.

The Vertues.

The properties hereof are wholly attributed to be the same with the Pine tree, as is before said, both for the barke and the leaves, but this not having any kernels, that are fit either to be eaten or used in physicke, we can say nothing of them.

CHAP. XCVI.

Abies. The Firre tree.

ALthough *Bellonius* and *Dodonæus* from him, doe follow *Theophrastus* and make two sorts of Firres, a male and a female, yet unlesse the Pitch tree may be accounted his male, I know not how it may be granted in our dayes: which if it be as *Clusius* and others seeme to yeeld unto, I marveile then what tree his πίτυς shall be. I have therefore but one sort of Firre to shew you, although I know some by the smoothnesse and colour of severall sorts of the wood, might argue them of differing sorts, yet I hold that not sufficient to make a severall species, no more then is seene in our Oake, which growing in some places will be smoother or rougher, tougher also or more brittle, of a paler or yellower colour, and with more or lesse veines therein then in others, which commeth to passe by the moist or dry, stiffe or sandy grounds wherein they grow. It groweth taller then any other, except the great Cedar, growing straight up to a great height, without either branch or knot, and covered with a rough hard brittle gray barke, the greater armes stand alwayes foure together, one opposite unto another in forme of a crosse, and grow upright, the side branches on the younger standing but by couples: this order it holdeth in all up to the toppe which is smallest, having risen like a *Pyramis* by degrees: the leaves that grow on the elder branches, stand without order, and are harder yet bluntly pointed, then those on the younger, which stand but on two sides, making the branches seeme flat, and very thicke set one unto another, like the teeth of a combe, and these of the younger growth are flatter then of the elder, oftentimes forked at the ends, of a pale fresh greene on the upper side, and grayish underneath, and smallest towards the ends: the aggiets or catkins that this beareth, are small and of a whitish yellow greene, enduring a whole yeare on the trees, after they have shewed their flowers: the cones or Apples thereof, are greater then those of the Pitch tree, and with broader scales, blunt or in some double pointed, on the inside of every scale almost lyeth a small seede, joyned to a thinne skinne like a wing, and abide greene untill Winter, and then grow

ripe

ripe, but alwayes ſtand upright, and yeeld much Roſſin in the Summer, but being wounded yeeld a yellowiſh cleare Turpintine, which is ſharper then that of the Larch tree, and fit onely for outward medicines: the wood hereof is ſoft and ſmooth, with many fouldes, and the knots are the hardeſt in any Timber.

Abies. The Firre tree.

The Place and *Time.*

This tree groweth in all the Countries of *Germany*, *Polonia*, *Denmarke* and *Muſcovia*, and in divers other Countries alſo in *Italy*, *Greece*, *&c.* in *Scotland* alſo, as I have beene aſſured, but not in *Ireland* or *England*, that I can heare of, ſaving where they are planted, and whether there were ever any growing naturally in *England* at any time heretofore is almoſt out of queſtion: The time is declared before.

The Names.

It is called in Greeke ἄδεν, and in Latine *Abies*, and ſo called by all Writers without variation, but that *Cluſius* and ſome others make it to be the *Abies fœmina* of *Theophraſtus*, as they would make the Pitch tree his *mas*, yet as I ſaid *Bellonius* and *Dodonæus* doe ſhew us another tree to be his *mas*, which yet is ſo like the Pitch tree, that if it be not it, we know not what to make it. *Bauhinus* alſo conſenteth unto them, and yet he calleth the *mas*, *ſurſum ſpectantibus conis*, when as their figure ſheweth them to be *dependentobus*. The *Italians* call it *Abete*, the *Spaniards* *Abeto arbol*, the *French* *Avet*, *Sap*, and *Sapin* alſo in ſundry provinces thereof, yet *Pliny* ſaith the lower part of the Firre is called *Sapinus*, and the knotty upper part *Fuſterna*, the *Germanes* as I ſaid *Thannenbaum* and *weiſz thannenbaum*, the *Dutch* *Dennemboom*, and we in *Engliſh* Maſt tree, Deale tree, but moſt generally Firre tree.

The Vertues.

The barke and dry Roſſin of the Firrē tree, is in propērty very like unto the properties of the Pine tree, but that this is more ſharpe and more clenſing. The cleare Turpintine or liquid Roſſin of the Firre, is hot and dry in the ſecond degree, and very clenſing withall, yet as I ſaid not ſo fit for any inward as outward medicines, being ſomewhat too hot ſharpe and nauſious to many, and eſpecially ſeeing we havē two other ſorts of Turpintine fitter for inward griefes, it is of excellent uſe in all ſalves and Balſames that are for the head, or any other greene wound or old ulcer, clenſing very much the old filthy ſores, and helping to heale them after, and ſodering up the lips of the freſh.

CHAP. CXVII.

De Reſinis. Of Roſſins.

HAving now ſhewed you all the trees that beare gummēs or Roſſins, I thinke it not amiſſe to entreatē a little more largely of the Roſſins, and Gummes themſelves apart, both to ſhew you the ſeverall ſorts of them, and the ſeverall manners of drawing them forth, which I could not either well doe before, or were omitted to ſpeake of them here, and have their names muſter all in one place, but becauſe Gummes and Roſſins would be too much to handle in one Chapter: I will onely make the Roſſins my taske in this Chapter, and the Gummes in the next, and for that Roſſin is of two ſorts dry and moiſt, I will ſpeake of them in each Section, but of the dry ones in the firſt place, and of the moiſt after.

Roſſin is an oilinous ſubſtance diſſolving and melting of it ſelfe by the heate of the firē, and apt to burne with a flame, and called ῥητίνη in Greeke, and *Reſina* in Latine, the dry Roſſin is called ῥητίνη ξηρὰ *Reſina arida*, and ῥητίνη μετὰ ὑγρότητος *Reſina fricta*, boyled Roſſin, that is, ſuch as from the Turpintine or liquid Roſſin is boyled with water in great kettles or cauldrons, into our ordinary yellow hard Roſſin or into blacke Roſſin, which is uſually now adayes called *Colophonye*, yet ſome ſay that *Colophonye* is the foote of the Turpintine, after the oyle is diſtilled from it, and ῥητίνη ὑγρὰ *Reſina liquida*, liquid Roſſin which is Turpintine.

1. *Reſina Cedri.* The Cedar Roſſins.

There commeth out of the great Cedar tree, a dry Roſſin of it owne accord, hardning upon the tree, which beīng chewed ſticketh ſo faſt to the teeth that it can hardly be pulled from it.

There is another alſo drawne from it that is liquid, and both of them called *Cedria*, but this liquid eſpecially, for that there is more ſtore of it gathered, and is of more uſe alſo, and is drawne from the tree by boring it at the young knots before the barke be rugged, and ſetting an hollow horne to the hole, that it may runne out thereat into veſſels ſet under to receive it, and is of as ſweete a ſent as the Strawberry ſaith *Lugdunenſis*, and not as *Dioſcorides* ſaith of a grievous ſent, for *Matthiolus* out of a very auncient manuſcript amendeth the word to be of a ſtrong ſent, or ſtrong ſweete ſent as *Virgil* his verſe doth intimate, *Urit odoratam nocturna in lumina Cedrum*: which may be underſtood of the wood alſo, but there is a certaine liquour called *Cedrium* by *Pliny*, and others, which

which is like our Tarre, and taken in the ſame manner from it, for they of *Syria* make Pitch of this Cedar, as alſo of the *Oxycedrus* the prickely Cedar, as we in *Europe* do of the Pine and *Teda*, that is, cut into ſtickes to burne this liquour commeth firſt from it in the burning, which is of that force and efficacy, that in *Egipt* they did beſmeare the dead bodies therewith ſundry times, which preſerved them perpetually from putrefaction, for being of a cauſticke quality, it did feede upon, and conſume the moiſture in the carkaſe, and ſo kept it from putrefying, but divers have confounded both the *Cedria* and the *Cedrium* together, and the pitch likewiſe calling them promiſcuouſly, ſome while *Cedria*, or *Oleum Cedrinum*, which is *Cedreleon ex malis Cedri*, ſaith *Pliny*, and at other times *Cedrium*, when as properly *Cedria* is the *Lachrymacruda Cedri*, or *reſina Cedri*, and the *Cedriumis*, the *Pix liquida Cedri*, and the pitch it ſelfe is *Pix Cedrina*, yet both the *Cedria*, and the *Cedrium* are of one operation: They in *Syria*, by *Pliny* his words in making pitch hereof, and of the Turpintine tree did uſe a kinde of furnace, wherein they piled their ſtickes, and made a fire round about the furnace, but put no fire within it, as we in *Europe* doe, in making pitch, as I ſhall ſhew you hereafter, when I come to ſpeake of the pine and pitch trees. *Bellonius* ſaith that of any of the Reſinous trees as well as of the Cedar is made *Cedria*, which both *Matthiolus* and *Lugdunenſis* doe worthily reprehend for ſo manifeſt an errour: The Vertues and properties whereof are ſet downe before, and neede not a repetition here againe.

2. The *Oxycedrus* or great prickly Cedar tree giveth a certaine dry Roſſin or Gumme as it is called, ſomewhat like unto the Maſticke, but that the graines are long, and of a more yellowiſh colour, but ſo dry if it be chewed betweene the teeth, that it will not be wrought into a paſte like Maſticke: but will be as a pouther in the mouth continually: this I take is called Gum *Iuniperi*, in the Apothecaries ſhoppes, and *Vernix* alſo, and *Sandarach* likewiſe, becauſe the tree is ſo like unto Iuniper, and *Lugdunenſis* ſaith that both the gum of Iuniper, and of the *Oxycedrus* are called *Vernix*. Hereof is made a moſt ſtinking Tarre, called by the *French huile de Cade*, when as they make pitch of the wood, as they do of the pine and pitch trees. This is moſt likely to be the ſweet Cedar of the *Bermudas*.

3. *Reſina Laricea*, The Larch tree Roſſins.

The Larch tree yeeldeth likewiſe two ſorts of Roſſin, one breaking out at the chinkes of the barke on the body and elder boughes, which is cleere and white like unto white dryed Turpintine, and ſmelleth reaſonable well, which will not be kept in drops, but will runne together into lumpes, untill in time it will grow dry and hard. It yeeldeth forth alſo a liquid Roſſin, when the tree is bored to the heart as is before ſaid, yeare after yeare, one or other, but not the ſame trees every yeare, one hole above another for eighth or tenne foote above the ground, which when they have ſo done on one ſide, they doe ſo to another, ſtill cloſing up the hole cloſe with a pinne or wedge, this yeeldeth ſaith *Pliny*, *lib. 16. c. 10.* a liquour of the thickneſſe of thinne hony, which never groweth hard, and againe in another place he ſaith, The Larch tree yeeldeth forth a thinne Roſſin of the colour of hony, ſmelling ſtrong, notwithſtanding that he had ſaid that it burneth no more then a ſtone, nor yet maketh any coales. *Vitruvius* alſo *lib. 24. c. 6.* ſaith the Larch tree yeeldeth a liquid Roſſin of the colour of the hony of *Athens*, which is good for thoſe that have a ptiſicke: but in that they ſay it was of the colour of hony, you muſt not underſtand the colour of our red hony, but ſuch as that Country of *Athens* gave, which was nothing ſo high colonred as ours, and which I do in part beleeve, led by divers reaſons, to thinke, that that liquid Roſſen which floweth out of the Firre tree, being ſomewhat neare the colour of our hony was the Turpentine uſed formerly in the Apothecaries ſhops but as *Matthiolus* aſſureth us, the cleare white Turpentine that is in moſt uſe in the Apothecaries ſhoppes for inward medecines, and called *Venice* Turpentine (in imitation of the true Turpentine which commeth out of the Turpentine tree, as divers Liqueurs are called Baſtames, in imitation of the true Baſſame) is taken from the Larch tree, whoſe properties are declared before.

4. *De Reſina Pini, & Picea.* Of the Roſſins, of the Pine tree, and of the Pitch.

The Pine tree yeeldeth forth a kinde of fatty or gummy Roſſin, that is of a whitiſh yellow colour, mixed up with a great deale of droſſe for the moſt part, and but little cleane Roſſin in ſeverall parts to be ſeene in it, which doth quickely become dry, and to be made into pouther, ſmelling ſomewhat ſtrong and ſweete, and is our ordinary or common Francumſence that is uſually burned in houſes and chambers, to aire and perfume them, called alſo *Parroſſin*, and in ſhops *Reſina pini in France Garipot*: this Roſſin runneth out of the trees of it owne accord, and eſpecially as *Matthiolus* and *Lugdunenſis* ſay, out of the *Cermolo* or *Teda*, as being the ſweeteſt, and falling upon the ground, is gathered from thence with what droſſe it hath gathered into it in the ſpreading, and ſo put up with whatſoever ſticketh to the barkes of the trees likewiſe, whereby it becommeth ſo foule as we have it, and therefore had neede to be melted and ſtrained before it be uſed, and then will grow hard and fit to be uſed, there is a kinde of dry Roſſin alſo gathered from the nuts or apples called *Reſina Strobilina*, which *Galen* maketh the chiefeſt and beſt of all other Roſſins, although *Dioſcorides* maketh it the laſt and worſt. It yeeldeth no other liquid Roſſin that I can learne: but from it and the ſorts thereof, before it turne into *Teda* as after, but eſpecially then, as having moſt ſtore of pitchy matter in it, is made the beſt pitch and moſt ſtore, and is made in *Europe*, where the trees grow, ſomewhat after the manner of making charcoales with us: For having prepared a place for the purpoſe, paved in the middle, and raiſed up alſo a little, with a trench round about it, for the pitch to runne into, they pile up the ſtickes and cloven wood, ſetting them upright to a ſufficient heighth and breadth, this pile or heape they cover with the branches of the tree, plaſhed cloſe together, and very well limed or lomed on the outſide, quite all over, that no chinke be therein, for if any happen it muſt be preſently ſtopped with lome, that no flame or fume paſſe out thereat, for feare of looſing all, and onely one hole left below, where the fire is to be kindled, which alſo muſt be ſtopped up after the fire is well kindled, and that the liquour beginneth to runne into the trench, which muſt have ſeverall gutters from it to be led from thence into others fit to receive the pitch as it runneth out: the Tarre and water with it runneth firſt out, which is kept together, and the pitch that commeth out after by it ſelfe, and then barrells are filled up with them ſeverally: the thinner liquour is called *Pix liquida* in Latine, and πίσσα ὑγρὰ in Greeke, and when it is boyled againe and made harder πίσσα ξηρὰ and πίσσα ἥψημένη *Pix arida vel ſicca*, and *recocta*, but the *Piſſaſphaltum* is a bituminous or hard pitch, taken out of the earth, and was uſed to be melted with Tarre to temper it, and make it ſerviceable for ſhips. The Vertues whereof being not ſpecified before, ſhall be ſhewed hereafter in the end of the Chapter.

5. *Reſina Picea.* The pitch tree Roſſin.

The pitch tree likewiſe thruſteth forth a whitiſh Roſſin gathered betweene the barke and the tree, and breaking out

out into drops, so like unto *Thus* or *Olibanum*, that many did counterfeit it therewith, as *Galen* saith *lib. 2. decomp. med. secund gener. c. 2.* and *lib. 3. c. 2.* who calleth it πιτυϊνον ῥητινη *Picea bulla*, and this peradventure may be that Rossin of the pitch tree, made in *Asia*, and called there *Sphagas* as *Pliny* saith, who also in another place saith hereof, that the pitch tree giveth a great deale of Rossin so like unto *Thus*, that being mingled together, they can scarse be discerned to be severall: this Rossin also is used to be mixed with the pine tree Rossin before spoken of, which is likely to be *Galen* his συνκομιση, and with them the *Resina strobilina* mixed all together: out of this tree likewise being wounded as in other trees for that purpose, is drawne forth a liquid Rossin, like unto that of the Firre tree, called by *Pliny Pix Brutia*, as I take it, which is redder then the ordinary Rossin, and peradventure may be also the *Colophony* of the ancients, which was like *Resina fricta*, and brought from *Colophony*, but more tenacious, as betweene Rossin and pitch, which I take to be that which is usually called with us now adayes *Burgony* pitch, which while it is fresh is somewhat soft in working, and sharpe in sent, but afterward growing as dry as a dry Rossin, that will easily be made into pouther. Of the wood and stickes hereof as of the pine, either together or separate is made pitch, as is before shewed.

6. *Resina Abiegna*, The Firre tree Rossin or Turpintine.

Some doe say that there is gathered from the Firre tree, a dry kinde of Rossin passing out thereof voluntarily as is before said of the pine and pitch trees, and put altogether to make our common Francumsence, which how true or false it is, I cannot either maintaine or disprove, the knowledge of many such things, although of daily use is not easily attained, by them that dwell farre from the naturall places of their growing. From this Firre tree being bored to the heart, as is done in other the like, and some say out of the pitch tree as well, issueth forth in the younger trees a cleere yellowish Turpintine or thinne Rossin, but from the elder somewhat thicker, which being put into great cau'drons is boyled with a double quantity of water, but I thinke twice double will not serve, so long even two or three dayes continually night and day, untill it become so throughly boyled and dryed, that it will not yeeld to a thrust, when it is cold, but will be hard and dry, and then is called yellow Rossin, and being molten a new is cast into great cakes, of an hundred weight a peece more or lesse, and according as the Turpintine is in cleerenesse and goodnesse so will the Rossin be, and this is the πιτινη ῥητινη of the Grecians, and *Resina fricta* of the Latines.

7. *Resina Cupressina*. The Rossin of the Cypresse tree.

There is some times found on this tree, a certaine kinde of dry Rossin, but so little that we have little knowledge thereof, and lesse use, *Dioscorides* and *Pliny* doe both make mention of a liquid Rossin, to be taken out of it as out of the Turpintine tree Larch tree and others.

8. From the Savine trees likewise of both sorts, in the hot Countries is taken a dry Rossin.

9. From the *Cedrus Lycia*, the Cypresse like Cedars of both sorts, is taken such like dry Rossins as from the *Oxycedrus* in small peeces falling to pouther in the chewing like unto it.

10 From the *Arbor vitæ* sometimes is taken a dry Rossin in small pëeces and small quantity.

11. From the *Arbor Thurifera* is gathered the *Thus* or *Olibanum*, but what the tree is from whence it was taken we know not, nor they that have made mention of it, for some say one thing and some another, so that I dare say no more of it here, but in the next Classis.

12. Of the dry or liquid Rossins taken from the Lentiske or Masticke tree, from the *Balsamum* or Balme tree, from the *Styrax* or Storax tree, and from the Turpintine tree, I have spoken sufficiently before, saving onely that I would give you further to understand that in *Syria*, and the parts neere thereunto they make pitch of the Turpintine in the same manner as they doe of the Cedar, besides the cleere true Turpintine that is drawne forth by piersing the tree, as in other Rossin bearing trees.

The Vertues of Rossin and Pitch.

Rossin in generall as *Galen* saith, that is of all sorts, is hot and dry, but they differ much one from another, in being more or lesse sharpe and hot, and of thin parts: the *Strobolina*, that is, the Rossin taken from the nuts of the pines is the hottest, and that from the Turpintine tree the most temperate, the dry white Rossin of the pitch tree is hot and dry, but yet is not so drying as the *Strobolina*, although more heating: that of the Firre tree is as a meane betweene them both, even as that *Colophony*, which smelleth and is like *Thus* or *Olibanum* is temperate likewise, the moistest of them all is that other sort of the Larch tree Rossin, which is the sharper, of the stronger sent, and more bitter taste: The *huile de Cade* or stinking Tarre, comming from the *Oxycedrus* or prickely Cedar when it is burned, healeth all scabbes and itch in man or beast, and other deformityes in the skin, as the Lepry morphew and the like, and performeth in a manner whatsoever the *Cedria* it selfe can doe. The Venice Turpintine boyled to a dry Rossin, is farre better then any other ordinary boyled Rossin to stay the flux of Gonorrhea. The common Francumsence, *Farressin*, or Rossin of the pine tree besides the uses to burne and perfume a house as is before said, it serveth in salves as a principall ingredient, to heale and fill up with flesh hollow ulcers, and to warme and comfort any cold griefe or part of the body: The Rossin of the pitch tree, called *Burgony* pitch, in being sharper and more hot, is much used for searcloathes against cold aches, and all sorts of paines and griefes proceeding of cold, and by reason of the sharpe and quicke sent, is the more piercing: The pitch it selfe is hot and dry in the second degree, yet mollefyeth hard knots tumours and swellings, it bringeth boiles and sores to supparation, and breaketh carbunckles, and blanes, dispersеth and scattereth botches and empostlumes, draweth forth corruption in sores, and healeth them by causing flesh to grow up in them, and is used in many salves, both oyntments and plaisters that serve to draw and to heale: The Tarre water that commeth first out and with the Tarre, doth kill any Tetter or Ringworme being used thereon, and likewise any itch, and healeth up scabbes or scalles in the head, the Tarre it selfe is hotter then the pitch, and is used saith *Dioscorides*, against poysons, as also is good for those that have the Tissick or cough, or rotten flegme stuffing the lungs, and for hoarsenesse and tough flegme, that will not easily be expectorated: being rubbed with salt on a place that is bitten by a Serpent helpeth it, and being mixed with as much waxe it taketh away the ruggednesse of the nailes, it helpeth the hardnesse of the mother, the rifts in the fundament, the chaps on the hands or feete, it stayeth also spreading ulcers, it breaketh or dissolveth the kernels under the eares and throate, called the Kings evill, being made up into a pultis with Barley meale, and a boyes urine, and applyed warme: it is likewise dropped into the eares with a little oyle of Roses to cleanse the mattering of them: it stayeth creeping ulcers applyed with Brimstone

or

or the barke of the pine tree, or with branne: The blacking that is made of the pitch when it is burned, healeth watering eyes, and the fretting sores in the corners of them: and with it and ordinary Turpintine well mixed, is made the Printers Incke where with they print Bookes, but not our ordinary Incke nowadayes, howsoever it might be in use in *Dioscorides* his time. The Turpintine that commeth out of the Firre tree is sharper and hotter then that of the Larch tree, and more nauseous to be taken inwardly as I said before, and therefore more usually put into salves, and for outward remedies: The Rossin that is made thereof is neere unto the property of Pitch clensing heating drawing, and mollefying as well, and drying more then pitch: the pouther of Rossin is almost as effectuall as Amber pouther in the running of the reines, experimented by sundry Chirurgions, who have used it instead of the best sort of dryed Turpintine, which is for the same purpose, either to try conclusions or to save charges: it is used with pitch in many salves, or without it for all the purposes whereunto pitch serveth for all greene wounds to heale them, and for all old sores and ulcers to clense them, incarnate and heale them up afterwards: it may be used in fumes with Olibanum, Mastick, and other things that are burned, and the head ayred with their smokes to helpe to dry cold rheumes, catarrhes, and distillations from the head. The Rossin of the Cypresse tree is heating and binding, and serveth effectually to all the purposes that is spoken before of the nuts or leaves, or what else thereof is used: The Rossins of the small Cedars are neere the property of the prickely Cedar, although not so effectuall or violent. In the like manner whatsoever droppeth or runneth forth from the Sabine trees is sharpe and hot like the leaves, &c. of the trees: and for the *Arbor vitæ*, although there hath been sometimes a kinde of Rossin found sticking to the barke of the tree, yet it hath beene in so little quantity, that I have not learned what use any hath made of it. The other Rossins of the Balme tree Turpintine, Lentiske and Storax trees are spoken of sufficiently in their proper Chapters, and need not a repetition here againe, of the same things there delivered: The Vertues of the *Thus* or *Olibanum*, you shall have in the next Classis with the relation thereof.

CHAP. XCVIII.

De Gummis arborum & herbarum earundemque succis concretis.
Of the Gummes of trees, and herbes, and of the dryed juyces of them.

THe Rossins of all sorts being declared in the former Chapter, there remaineth to speake of Gums issuing both out of Herbs and Trees, and the condensate juyces of plants, yet I must except out of this number and Chapter the gummes and dryed juyces, whose plants are not knowne to us, from whence they proceede, and that are brought of old or of later dayes, from the East or West Indies, which are of use in physicke, for I determine to handle them in the next Classis, with the forraigne drugges in the Apothecaryes shops. I have as you see here joyned the condensate juyces unto the gummes, because to them that know not their manner and nature, they seeme to be gummes, one as well as another: and that I may shew you the difference betweene a gumme and a dryed juyce, and both of them from the Rossins before spoken of, thus they are: Gummes are of two sorts, one that is of a watery or earthy substance, and will dissolve in warme or cold water, wine, or the like, and not in oyle, nor melt of themselves, being set to the fire, and will burne without flaming, and such are the Gummes of many trees. The other is oylious or unctuous and in part resinous, in that it cleaveth so fast to any thing toucheth it, and that will not dissolve with cold water, wine or vinegar, but onely with warmed wine or vinegar, and will also better dissolve of themselves being set to the fire, then the other gummes will, and will give a flame in the burning, yet nothing so much as the Rossins, which as I shewed before are wholly unctuous, melting with heate of fire, and burning with a flame like oyle and such like unctuous matter being set on fire: Another difference of a Rossin from a Gumme is this, that all Rossins although I quid (some sooner or later then others,) will be dryed to be made into pouther; the juyces have scarse any of them any unctuous matter in them, being onely composed of a watery and earthy substance, condensate together, which wholly dissolveth with water and turneth like earth: to begin therefore.

1. *Gummi Arabicum.* Gumme Arabecke.

Is a certaine cleare white Gumme that is brought from the parts beyond the Seas, and is taken to be the Gumme that commeth out of the *Acacia* tree of *Egipt* by many good Authours, *Bellonius* also confirming it, who travailed through those parts, and observed it, and *Alpinus* who lived a while in *Egipt*, yet some have taken it to be the gumme of plumme trees, or of other trees growing in those parts: It is of sundry formes and colours, for some are in round hard dry peeces, of the bignesse of a Tennis ball, or bigger, or not halfe so great or lesse, all of them rugged and not smooth on the outside, but whitish for the most part which being broken is cleare pure, white and transparent, yet some more or lesse then others, and some are very small long peeces, and therefore called *vermiculatum*, and held for the best, being in substance like the other peeces of the same greater size, are reddish, yet cleare and transparent also, which some take to be the gumme of some other tree, because it is of such a different colour, but that is no sufficient reason to disprove it, for we see in divers others sorts of gummes, that the severall peeces doe not all hold one forme or colour, and yet are true: this dissolveth not in water, and serveth as a glew to stiffen binde, or fasten many things: the tree hereof shall bee declared the second Chapter after this, for the manner thereof, it distilleth or droppeth out of the tree in bigger or lesser peeces, as either nature list to thrust it forth, or as it is helped by cutting the barke and giving it way to issue forth, which sticking too, and not falling off or upon the ground, is so gathered and reserved.

2. *Gummi Prunorum & Cerasorum.* Plumme tree and Cherry tree Gumme.

The Gums of both these trees come forth in the same manner that is said of the former, being of severall colours each of them, that of the Plumme tree for the most part being whiter then the other, which is redder: yet both of them cleere and more clammy then the former, and vary, some of the Plumme trees being reddish, and of the Cherry trees white.

3. *Gummi*

3. *Gummi Amygdalarum & Perſicorum.* Almond and Peach tree Gummes.

Both theſe trees likewiſe yeeld Gummes very like unto the Plumme and Cherry tree, that it is ſomewhat hard to diſtinguiſh them, but that they are ſomewhat whiter and a little dryer. Thus having ſhewed you all the Gummes of the Trees that are knowne to us, let me in the next place ſhew you the other ſorts of Gums, taken for the moſt part from the rootes of Herbes and plants.

4. *Gum Tragacantha.* Gum Tragacanth.

This Gumme as I have ſhewed before in ſpeaking of the plant called Goates thorne is taken from the rootes hereof as they grow, a pit being made round about the roote, which will in the greateſt heate of Summer, being deepely wounded, thruſt forth very ſlender ſmall peeces, crooked or writhed, ſeldome greater then a tagges point, or ones fingers end, and moſt uſually a great deale ſmaller; ſome very pure white, and others a little yellowiſh, and ſome more reddiſh, much of it gathering droſſe, which ſticketh faſt unto either barke or ſtones, or earth, or the like: the gumme it ſelfe is ſweetiſh in taſte, and quickely relenting in water into a gelly, like made ſtarch, and glewing things together as firme as ſtarch or glew, in ſmall and thin materials. The properties hereof are declared with the plant.

5. *Opopanax.* The Gumme Opopanax.

This gumme taken from *Panax*, the All heale of *Hercules* is a yellow gumme, very browne on the outſide and yellow within being broken, the beſt is pure or ſincere, that is, not mixed with ſtickes or droſſe, but cleane gum, and in ſmall drops, yet ſticking faſt together, of a ſowriſh ſent, and ſomewhat ſtrong, and being diſſolved with wine or vinegar, will make it looke yellow, even as the herbe it ſelfe, being broken will yeeld a yellow ſap or juyce in our owne Land: from the rootes chiefly and not from the ſtalkes is this gumme taken, in the like manner as I ſhewed you of the gumme tragacanth by digging a hole round about the roote, and laying boordes or tyles or the like, round about, and in the bottome to keepe the gumme cleane, from earth, ſtones, or any other thing that might foule it, falling among it after the roote is cut in three or foure places, as ſome doe, or making a hole or two therein as others doe, whereunto the gumme will be drawne, and from thence flow forth: In the Claſſis of Vmbelliferous plants are the Vertues expreſſed whereunto I referre you.

6. *Galbanum.* The Gum Galbanum.

The great *Ferula* or Fennell giant of one ſort, is the plant from whence this gumme is taken, and that not in every Country for that onely which groweth in *Syria*, as *Dioſcorides* ſaith yeeldeth Galbanum, the rootes being wounded in the ſame manner as is before ſaid of the *Panax*: the gumme ſmelleth ſtrongeſt of any of the *Ferulaceous* gummes, and is if it be ſincere a little yellowiſh, with white peeces amongſt it, and divers parts of ſtickes or ſtalkes broken among it, and ſometimes the ſeedes alſo, ſo clammy and tenacious that one can hardly touch it without cleaving to their fingers, and diſſolving onely with wine or vinegar.

7. *Sagapenum.* The Gum Sagapen.

As *Syria* bringeth forth the *Ferula*, from whence *Galbanum* is taken, ſo is *Media* the nourſe plot, as *Dioſcorides* ſaith, where the ſame or another *Ferula* groweth, from whence the gumme *Sagapenum* or *Serapinum* is taken in the ſame manner that the former is, and doth not much differ from it, but that it is not ſo clammy, or gummy, but dryer, and of a redder colour, and ſmelleth not halfe ſo ſtrong or ſtinking as it doth: The Vertues both of *Galbanum* and *Sagapenum*, are amply ſet forth under the title of *Ferula*.

8. *Gum Ammoniacum.* The Gum Ammoniacum,

This gumme likewiſe is taken from a *Ferula* as it is ſaid, growing in *Cyrene* of *Africa*, ſo that you ſee the diverſity of the climate, although in one and the ſame plant produceth diverſities of gums, differing both in forme and operation: this gumme is much whiter then any of the three laſt mentioned, pure and ſincere without any ſticke or ſtalke in it, and with many whiter peeces among it, and not ſmelling any thing ſo much as the *Sagapenum* doth, which alſo being diſſolved, will be whiter then any of the former. The properties of this Gum is very like unto the two laſt of the *Ferulous* gums, and thereunto you may referre it.

9. *Euphorbium.* The gum of the burning thorny plant.

This gum is taken from the thorny plant *Euphorbium*, as we have beene alwayes informed from others, and not from any kind of *Ferulous* plant, as *Dioſcorides* ſaith, the forme of which plant, as it hath come from beyond the Sea unto us, even a ſmall plant, we have here before exhibited unto you, the gum is of a browne yellowiſh colour, and ſomewhat whiter within, in almoſt as ſmall graines and drops as Maſticke, of a moſt violent burning hot piercing ſent, piercing the noſtrils if it be but a little ſtirred, but much more and allmoſt intollerable to him that ſhall beate it, and more to them that ſhall take it inwardly, the properties hereof are declared with the deſcription of the plant.

10. *Sarcocolla.* Sarcocoll.

This is a ſmall reddiſh and whitiſh gum, in very ſmall peeces and pouther, little bigger then Poppy ſeed, ſomewhat bitter in taſte, and ready to provoke caſting, but of no ſent almoſt at all, *Dioſcorides* ſaith it is taken from a tree in *Perſia*, which neither he deſcribeth, nor we have any further knowledge of, it cleanſeth and dryeth, it cloſeth up greene wounds, and ſtayeth catarrhes, defluxions and redneſſe in the eyes.

11. *Gum Hederæ.* Gum of Ivy.

The gum that is gathered in the hot Countryes from the ſtems and greater branches of the Ivy tree is of a very darke red or browne colour, comming to us in ſmall drops, cleaving faſt together in lumpes, a little cleare, and of ſomewhat a ſtrong ſent, but very ſharpe and burning: it killeth nits and lice, and ſome doe put it into a hollow tooth to helpe the ach, being mixed with things convenient for it: ſome uſe this gumme with other things, and ſome alone; made up with a little hony and crummes of bread into a paſte, and caſt it into ſtanding pooles and ponds of fiſh to make them turne up their bellies and lye as dead above the water for a ſmall time, that they may be taken, which will returne to their ſenſes againe.

12. *Scammonium.* Scammony.

I have made a long narration hereof in the ſecond Claſſis of this Work, whereunto I muſt referre you, and onely ſhew you here that the generall vote of the Writers thereof, is that the juyce hereof is taken from the rootes of the plant, ordered in the ſame manner that is ſhewed in gathering the gummes of *Panax* and *Ferula*, &c. but I am halfe perſwaded it is otherwiſe, and made in another manner, becauſe it doth not condenſate into graines

or

or ſmall peeces as thoſe aforeſaid, but is made into a whole uniforme lumpe or maſſe, of a darke grayiſh colour, ſomewhat light and not ponderous, a little ſpongy alſo, or with ſome holes in it, ſomewhat cleare and not muddy or droſſie, of a ſtrange and ſtrong taſte, almoſt procuring caſting, and giving a ſhew of milke upon the moiſtening with the tongue, but not burning in the mouth or throate, for that is a ſigne of adultering: The qualities are expreſſed at large in the place before named.

13. *Aloes.* *Aloe ſuccotrine.*

The Herbe *Aloe*, or Sea Houſeleeke, I have likewiſe largely entreated of in the ſaid ſecond Claſſis before, with the whole manner of drawing out and preparing the juyce, whereunto I muſt referre you, ſo to ſave a tautologie or repetition of the ſame things againe, which were too tedious.

14. *Opium.* *Opium.*

This alſo with all that can belong thereunto, I have expreſſed in the Chapter of Poppy before, and cannot adde unto it any thing, more then is there ſet downe with the Vertues and Cautions, in as ample manner as I can.

15. *Elaterium.* *Elaterium.*

After I had given you the deſcription of the wild Cowcumber, in the ſecond Claſſis before, I declared the making of the *Elaterium* of two ſorts, both greene and white, as may be ſufficiently gathered from what is there ſaid, and therefore I ſhall forbeare to ſay any more thereof in this place, referring you thereunto, where the properties are alſo expreſſed.

CHAP. XCIX.

Palma. The Date tree.

ALthough there be divers kindes of trees that goe under the name of *Palma* in Latine, whereof *Pliny* in his time mentioned three ſcore and one, and ſince his time many others not knowne to him, have beene brought to light, yet there is but one kinde of Date tree properly ſo to be called without variety, howſoever the climate where they grow, ſeeme to make a diverſity, of greatneſſe or goodneſſe one from another in the fruite, ſuch as *Theophraſtus* and *Pliny* reckon, and although againe, for want of a fitter *Engliſh* name, as the former Writers have thought, they have beene called Date trees generally: yet I would if I could avoid that improper name, and rather call them Palmes for the diſtinction of them: I will therefore in this place give you onely the deſcription of the true Date tree, and thereto adjoyne two other called *Palmitos*, which others doe account low or wilde Date trees; when in truth they have little or no reſemblance thereunto, ſaving a little in the leaves, and ſpeake of ſuch other Palmes, as have come to our knowledge, in the next Claſſis.

1. *Palma vulgaris.* The ordinary Date tree.

The Date tree uſually groweth very great and tall, yet in ſome places nothing ſo high as in others, bare of branches unto the toppe, the barke whereof is not ſo well to be ſaid ſcaly or rugged, as knaggy, having ſhort knagges, which are the ends of the middle ribbes of the leaves, ſticking out round about the body, which give an eaſie footing like ſteps, to climbe or get up into the toppes of the trees to gather the fruite, the leaves that grow at the toppe are very long and large, made as it were of divers parts, and foulded together double; the middle rib being thicke and almoſt wooddy, but ſpongy within, which doe alwayes abide greene, and hang downewards with their ends: the flowers are encloſed in a long skinny ſheath, hanging downe from the lower branches of leaves and ſometimes higher, which opening it ſelfe at the end into two parts, ſhew forth a number of white Saffron-like ſmall flowers, hanging by ſmall threds in great bunches togethe; after which come the fruite, upon the ſaid threddy footeſtalkes, greene at the firſt, and reddiſh when they are ripe, with a hard firme ſmall long and round whitiſh ſtone with a furrow in the middle: ſome ſorts are ſmall, and ſome great, ſome of a ſoft ſubſtance ſome firmer and harder. ſome whitiſh, ſome yellowiſh, or reddiſh, or blackiſh, ſome round like an Apple, others long with the roundneſſe, ſome having the toppe ſoft, and ſome none at all, ſome ſo ſweete and luſhious that they will not keepe long, unleſſe they be preſſed into cakes to be kept, others will abide whole for a long time, and fit to be ſent alſo into any farre Country: yet all of them having a ſmall round hard crowne or cap at the head, which with rubbing one againſt another falleth off: the ſtones within the fruite, notwithſtanding that they are ſo ſollid and firme as a very ſtone, and can hardly be broken with an hammer, yet having a ſmall hollow place in the middle of them, with ſo ſmall a kernell therein, that it would not be thought to ſpring thereby, yet being put wholē into the ground hath ſhot forth long narrow hard leaves, and have abiden in a convenient warme place divers yeares, without any great progreſſe, ſo little it liketh ſo cold a climate.

2. *Palma humilis ſive Chamæriphes vel Palmites.*

The wilde or low Date tree called the *Palmito* tree.

The *Palmito* or low or wilde Date tree groweth in divers places of *Europe*, not to be above a yard high in the ſtocke or body, ſhooting out leaves from thence very like unto the former Date tree, but much leſſer and ſhorter: this beareth a round head at the ſide of the leaves, compoſed of many foulds of skinnes, which breaking open, ſhew forth a number of white flowers, ſtanding upon ſmall thready ſtalkes: this head being cut off, before it open it ſelfe for flowers, is very delicate to eate like a Coleflower or Cabbage, and more pleaſant then either Hartichoke, Chardon, or Tartouſli be, and are ſerved to rich mens tables for a ſallate of great delight.

3. *Palma Chamærops Plinij ſive Chamæriphes ſpinoſis foliis.* The Thorny *Palmito.*

This groweth in a manner wholly like the laſt, but the leaves being made as it were of many hard plaites have many ſharpe and ſhort prickes or thornes, on the backe of them, and the ſtalkes of them likewiſe, whereby it differeth from the other, whether the heads and fruite be alike, I cannot certainely heare.

The Place and Time.

The manured Date tree groweth in all the Eaſterne Countries generally, *Galen* and *Pliny*, with others commended thoſe eſpecially above others, that grew in *Iudæa*, and in the valley of *Hiericho*: *Bellonius* ſaith, they deſerved not commendations, neither were they ripe about *Ieruſalem*, above a moneth after they had beene gathered in *Egypt*: they grow alſo in *Italy* where they are planted but beare no fruite, and in *Spaine* by the Sea ſide,

Palma vulgaris optima.
The ordinary and true Date tree.

Palma cum fructu & flore.
The blossom and fruite of the Date tree.

2. Palma humilis sive Chamæriphes.
The wild or low Palme, called the Palmeto tree.

3. Palma Chamarops Plinij sive Chamæriphes spinosa folio.
The thorny Palmito.

but the fruite is nothing so good as in *Cyprus* and the *Levant*. The other two sorts grow, the first in *Sicilia*, *Candy*, &c. the other in *Spaine*: they flower in *Aprill*, and are ripe in *November* or later.

The Names.

The Date tree is called in Greeke Φοινιξ *Phœnix*, in Latine *Palma*, and the fruite Δάκτυλοι ἡ φοινίκες *Palmulæ* and *Dactyli*; the sheath or skin which encloseth the flowers, is called Ἐλάτη *Elate*, and σπάθη *Spatha*, and some thinke one kinde of Date is called *Palma Elate*: the best sort of Dates are called *Caryotæ* and *Phœnicobalanis*, which were also called *regiæ*, because they were fittest for the dyet of Kings. *Thebanes* were the leane dry Dates, that had little substance in them: the ancient Writers have set downe many things of Dates, that there is male and female, and that they both beare fruite, so that they be within the sight one of another, or else they will not beare, but I pray you account this among the rest of their fables. The second is called χαμαιρόφις by *Theophrastus*, and *Chameriphes* in Latine by *Lobel*, *Lugdunensis*, and *Palma humilis* also by *Mattholus*, and *Palmitce* or *Palmito* by the vulgar in *Italy*, *Spaine*, &c. the Greekes also call that head that is eaten ἔμβρυον, the *Italians* and *Spaniards* *Cefaglioni*, The other is called by *Lugdunensis* *Chamerops Plinij*. The *Arabians* call the Date tree *Machla*, and *Nachal*, and the fruite *Tamar*, the *Italians* *Palma* the tree, and *Dattoli* the fruite, the *Spaniards* *Palmeira*, and *Tamaras*, and *Dattiles* the fruite, the *French Palmier*, and *Daslier*, and *Palmes*, and *Dactes*: the *Germanes* *Dattelbaum*, and *Dattelz*, the *Dutch Dayeboom*, and *Dayers*, and we in *English* Date tree, and Dates.

The Vertues.

The unripe Dates are very harsh and binding, and the ripe also while they are fresh more then when they are dry, staying womens courses, vomittings, and the laske of the belly, and stay also the bleeding and falling downe of the fundament and piles, being taken in red wine: if they be used that are dry, they helpe the hoarsenesse and roughnesse of the throate, the sharpe cough by reason of sharpe rheume falling on the breast and lungs, the decoction of them taken, alayeth the force of hot agues, and stayeth spittings of blood, the paines in the stomacke and bowels, because of a flux, and boyled in old *hydromel*, that is, mede or honyed water, and taken doth refresh the spirits: used likewise in brothes or meates they doe the like, and somewhat provoke unto venery, but being taken too often, or too liberally, they breed head ach, and a kinde of perturbation of the braine, like unto drunkennesse, and the leprosie also as it is said, the sheath out of which the flowers breake, is very astringent, and so are the leaves also in the cases aforesaid: the decoction thereof maketh the haire blacke, being often used, and stayeth fretting ulcers, and helpeth the weakenesse and paines in the backe, in the bladder, and in the bowels: the Date stones being burned and washed serveth in stead of *Spodium*, to binde and restraine the fluent humours into the eyes, and to consume the pinne and web in them, and to dry up pushes being used with Spike nard, it stayeth the falling of the haire from the eyebrowes: being mingled with wine and used, it helpeth any excrescences out of the flesh, as wennes and such like, and bringeth foule ulcers to cicatrising: *Diaphœnicon*, which is the Electuary made of Dates, purgeth choller and flegme very effectually, so it be taken with good caution and advise, and that from two drammes unto sixe in white wine, or a decoction of Sene, as shall be thought fit, and is conveniently given in compound and long agues, and in those diseases that are bred of raw humours, as in the chollicke the paines of the backe and mother. The head of the Dates, or Date braines, is very pleasant and savoury to the taste, and is much used where they grow to be eaten with a little Pepper and salt: of the leaves of the *Palmito* they use to make Broomes to sweepe the house, which last a long time; of them likewise they make Mats, and Baskets.

CHAP. C.

Acacia sive Spina Ægyptia. The *Egiptian* thorne or binding Beane tree.

DIoscorides hath made mention of two sorts of *Acacia*, the one of *Egipt*, and the other of *Cappadocia*, and *Pontus*: *Theophrastus* also speaketh of two sorts, blacke and white: that of *Egipt* is reasonable well knowne, but of that sort of *Pontus*, there is some controversie among Writers, some taking one bush to be it, and others denying it to be it, the differences of *Theophrastus* sorts are onely expressed in the wood, as it is likely, the white to rot quickely, and the blacke to be long lasting and of very good use to many purposes, *Dioscorides* having described them. I shall therefore here shew you them, and with them adjoyne another sort of *Acacia* brought out of the West Indies, mentioned by *Aldinus* in his *Farnesian* garden.

1. *Acacia sive Spina Ægyptia vera.* The true *Acacia*, that is *Egiptian* thorne or binding Beane trée.

The *Egipt an* Thorne groweth in some places to be a great tree, and rather crooked then straight or rising high, covered with a blackish barke, spreading abroad great armes and branches, full of sharpe thornes, with many winged leaves set on both sides of them; that is, with foure winges of leaves on a side, made of sundry small ones, set opposite on a middle rib, without any odde one at the end, although it be so expressed, *Bellonius* saith that he counted 350. of those small leaves, that were upon the whole branch, and yet all of them might but cover his thumbe: the flowers grow among the branches, like flockes of wooll, of a whitish yellow colour, where after come somewhat large and thicke huskes, like unto the *Lupine* or flat beane cods, blacke when they are ripe, and bunched forth against the places where the seedes lye, in some three or foure, and in some more, each as bigge as a small wild Beane, round, and of a grayish or ash-colour, almost shining: the tree abideth alwayes with greene leaves thereon, and yeeldeth of it owne accord a white gumme in small curled peeces like great wormes, and greater round peeces if it be wounded.

2. *Acacia Americana Farnescena.* The West Indian *Acacia* or binding Beane trée.

This Indian *Acacia* groweth like unto the Hasell nut tree saith *Aldinus*, with many stemmes if they be not cut away that it may rise to be a tree, with slender and flexible branches, covered with a smooth thinne barke, like the Hasell, the young ones being of a greenish ash-colour on the North side, but that next the Sunne more pale, spotted with white spots: the leaves hereon are variable, which although they be all winged, yet some have but foure leaves on a side, some have five, sixe, seven, or eight, with an odde one at the end, each paire set opposite, and

1. *Acacia vera sive Spina Ægyptiaca.*
The Egiptian Thorne or binding beane tree.

2. *Acacia Americana Farnesiana.*
The VVest Indian Acacia or binding beane tree.

like unto Lentilles, closing or foulding themselves upon the Sunne setting, and opening againe after the rising, having at the foote of every stalke two long thornes set, reddish at the first, and white after: the first flowers come forth in the beginning of *July*, after some few leaves have shot forth from the old wood, but not in any plenty, yet bring the fruite to ripenesse after: but in the beginning of *September* more plentifully, yet without any fruite following them: these flowers at the first are greene, and like a small Strawberry, growing yellowish after, and whitish within two or three dayes like unto a pill, or small round ball, consisting of a flocky or woolly substance, many of them set together, and have many small threds in the middle with yellow tips, of a very sweete sent, like unto the sent of Wall flowers, which hold their sent long after they are dry: from the middle of the flower come forth divers cods, yet sometimes but one or two, or three, and sometimes more, greene at the first, and blacke when they are ripe, like crooked round hornes, while they are greene, of a very harsh and binding taste, but growing ripe they are lesse astringent and the huske more sharpe, and then doe somewhat resemble the cods of *Lupines*, but a little crooked, being halfe a foote long, and about an inch thicke, somewhat round and bunched out, where the seedes lye, which huske is very tough when it is dry, wherein are divers hard blacke seedes, like unto those of the sweete Beane or *Carab* tree, thrust thicke together without order, the wood hereof is hard and whitish, but blackest at the heart, without either sent or taste: this doth in many things agree with the former, but the greatest difference is in the huskes with seede, this having many, and the other but three or foure at the most, The like hereunto *Lobel* mentioneth in his *Adversaria*, *pag.* 409. that he saw with Master *Morgan* Queene *Elizabeths* Apothecary.

3. *Acacia secunda sive altera Dioscoridis.* The true second *Acacia* of *Dioscorides*.

This bush hath an upright stemme three cubits high or more, covered with a smooth sad greene barke, the wood being soft and easie to breake, and not very thicke of long thornes, the leaves are small, standing three together upon the branches, the flowers are small and yellow, whose succeeding seede seated in small huskes, are round, hard, flat and yellowish, somewhat like to Broome seed: This shrub seemeth very like to the *Aspalathus secundus* of *Dioscorides*, but differeth notably therefrom, in that the *Aspalathus* is thicker set with greater whiter and sharper thornes, with fewer and smaller leaves, flowers, and seede vessels, and the wood thereof is hard, and not easie to be broken.

The Place and *Time*.

The first groweth in *Arabia* plentifully in many places, and mount *Sinai*, and in *Egipt* also, and flowreth and beareth fruite twice a yeare, whereby we may well say, it beareth ever greene leaves: the other came out of the West Indies, *Aldinus* saith his came from Saint *Domingo*, but from whence that which Master *Morgan* Queene *Elizabeth* her Apothecary had long agoe, as *Lobel* setteth it downe in *Adversaria*, is not knowne whether it came from thence or no, the seedes springing in Cardinall *Farnesius* his Garden in *Rome* as it is set forth by the said

3. *Acacia secunda seu altera Dioscoridis.*
The true *Acacia* of *Dioscorides*.

said *Aldinus* in his description of some rare Indian plants growing therein, and flowred and bore fruite as it is expressed in the description. The last in *Candy* and *Grecia*, as *Pona* saith.

The Names.

Dioscorides calleth it in Greeke ἀκακία, and *Acacia* in Latine also, and *Theophrastus* ἄκανθος & *Spina* simply without any other adjective, whereof he maketh two sorts as I said, *alba* and *nigra*, the white being weake and quickely rotting, the blacke being strong, fit to build houses, and ships, &c. *Alpinus* maketh them to be *mas* and *femina*, the male fuller of thornes and without fruite, the female having fewer and gentler thornes, and those within the branches, bearing plentifully. *Pliny* also calleth it *Spina Ægyptia* in some places, distinguishing it from the *Arabica*, and in others confoundeth it with the *Spina Arabica*, which are much differing, this being a Thistle as it is shewed among them, and that a Thorny tree: Some have thought that the *Acanthus baccifera* of *Virgill*, mentioned in the second of his *Georgickes*, in these words *Quid tibi odorato referam sudantia ligno Balsamaque & baccas semper frondentis Acanthi*, should be this tree, as *Servius Grammaticus*, and *Christoferus Landus* both of them Commenters upon *Virgill* say; but without true judgement as *Guilandinus* noteth it, who would referre it to the *Acanthus Ægyptia* of *Athanæus*; *Marantha* referreth it to that kinde of *Ebenus*, whereof *Pliny*, *lib.* 12. *c.* 5. maketh mention, but there is as little certainety in this, as in the former, for concerning this it is not specified by *Pliny*, that it either beareth berryes, or yet abideth ever greene, and for the former, this *Acacia* beareth not berryes, such as no doubt *Virgill* meant: but it is most probable he intended, the *Pyracantha*, that we most usually so call, for *Pliny* so called it also, and *Spina* as some have it, or *Spinus lib.* 15. *c.* 24. where he saith *Baccæ Aquifolij & Spinæ sine succo*. But now concerning the juyce of *Acacia*, the true and not the substitute should be used in those two famous compositions, *Mithridatum*, and *Theriaca Andromachi*, and there is no doubt, but our Apothecaries might have sufficient of the true to use, and expunge the substitute, if they would bespeake the true to be brought, being made there in *Egipt*, where the tree groweth of the greene cods, which *Acacia* will be reddish, such as I have seene with Master *Boxe* the Drugist, which is the best: or else made of the cods which will be blacke, for if the Apothecaries would themselves extract the juyce out of them, and condensate it *secundum artem*, they might have enough of the cods brought them for that use. *Lobel* mentioning the *Acacia*, in the place before recited, saith that *Sequinus Martinellus*, a Physitian and Apothecary of *Venice* sent his brother *Albertus*, divers sackes full of these cods, whereof some was reduced into juyce, and some of the seedes were planted and grew into trees, as *Lobel* there mentioneth. The hardned juyce likewise is called *Acacia*: some have called it *Spina Christi*, thinking that Christs Crowne was made of the boughes of this tree, but it is more probable it was made of the *Paliurus*, it is now generally through all *Turkie* called *Acacia*, and so likewise of the *Egiptians*, as *Alpinus* saith, and *Sant* also: *Rauwolfius* saith that the *Arabians* at *Haleppo*, call it *Scamuth*, and *Schacke*. The Gumme that commeth out of the tree, whether voluntary or by incision is called *Gummi Arabicum*, although divers doe doubt that the gumme that beareth that name, is not the gum of this tree but some other, yet it is assured to be right by *Alpinus*, *Bellonius*, and others, yet there is a small sort of gumme likewise brought to us, of the like whitenesse and clearenesse with the other, but is *Vermiculosum*, in small crooked peeces like unto short thicke wormes. The second is called by *Aldinus Acacia Indica Farnesiana*, who hath made a long comparison betweene it and the former *Egiptian*. The last is remembred by *Pona* in his *Italian Baldus*.

The Vertues.

The hardned juyce extracted by decoction out of the cods of this tree, and called *Acacia* as I said, with the gumme thereof are the most especiall parts thereof we know are used. yet the juyce of the leaves and the rest worketh like them, but farre weaker: the juyce being used in all such diseases as neede binding, cooling, and strengthning, and staying vomitting, used inwardly or outwardly: and is available in the defluxions of hot humours into the eyes to stay them, and the abundance of womens courses, with the falling downe of the pallate, and of the fundament, and the flux of the belly, and the spitting of blood, and all bleedings, it resisteth also creeping ulcers, Saint *Anthonies* fire in the beginning, and helpeth the ulcers of the mouth, and secret parts, kibes, and chilblaines, and the growing of flesh over the nailes, and to fasten loose teeth, and the fluxe of humours to the joynts, that weakeneth them, and when they have beene bruised or put out of their place: the same also made into a decoction and the haire rubbed or washed with it, maketh it blacke, and is much commended to those that have the gout: the gum hath a property of thickening, and cooling, and to represse and coole the heate, and sharpenesse of humours, and to binde or close up the open passages of the skinne, and keepeth the places from blistering

that are burnt with fire, being used with the white of an egge: it serveth also for Limmers to fasten their colours for Dyers also in their Dying, for inke, and many other externall civill uses.

CHAP. CI.

Arbores alиæ spinosæ & siliquosæ Indicæ. Certaine other thorny Indian trees, bearing cods.

I Have certaine Indian Thorny trees to bring to your consideration that beare cods, whereof some have beene entitled *Acacia*, but I call *Pseudoacacia*: Another very like thereunto, called by our Colony in *Virgima*, *Locus*: whereunto I have adjoyned a third which hath growne with us, and a fourth called the Corall tree, and because they are differing much from those in the former Chapter, I have thought it fit to make a Chapter of them peculiarly.

1. *Pseudoacacia Americana Robini.* *Robinus* his false *Acacia* of *America*.

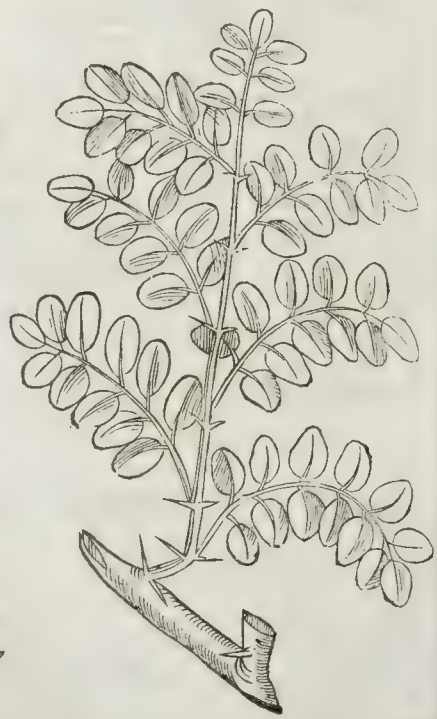
Because *Jacobus Cornutus* in his Booke of *Canada* plants, hath entituled this tree *Acacia*, although with little judgement; I have given it a place with another *Virginia* like it, but not with the true ones as is most fit. The body (saith he) is smooth, covered with a comely smooth blackish barke, without any thornes thereon at all, spreading the armes and branches very farre, which while they are young are pithy within, beset with many cruell sharpe thornes, flat at the bottome, ending in a small sharpe point: the leaves are many set on both sides of a middle ribbe, from seven or eight, to terne or more on a side, and an odde one at the end, each leafe foulding it selfe double every evening upon Sunne setting, and opening againe upon the rising: the flowers are white, somewhat like Pease blossomes, or those of *Cytisus* Tree Trefoile, many set together on a stalke, standing upright and not hanging downe, shewing themselves in *August*, after which follow hard rough prickly pods, but I and others had from *Robinus* such smooth pods as is expressed in the figure, under the other, in each whereof was enclosed one or two small browne Lentill-like seedes. By this description you may plainely see how much it differeth both from the true *Acacia* of *Dioscorides*, and the other *American* of *Aldinus*, having nothing therein but thornes answerable; and therefore in my judgement it doth better agree with some *Spartum spinosum*, then *Acacia*, but that it is a tree.

2. *Arbor siliquosa Virginensis spinosa, Locus nostratibus dicta.* The *Virginian* Locus tree.

A very like tree hereunto hath beene sent and brought us out of *Virginia*, growing to be a very great tree, and of an exceeding height with Master *Tradescant*, whose body is covered with a smooth barke, the young branches being greene, and set with somewhat sharpe prickles at every joynt, where the winged leaves come forth,

1. *Pseudoacacia Americana Robini.*
Robinus his false *Acacia* of *America*.

2. *Arbor siliquosa Virginensis spinosa Locus nostratibus dicta.*
The Virginia Locus tree.



which

3. *Arbor ſpinoſa Indica muricatis ſiliquis.* The prickly codded Indian tree.

4. *Siliquoſa & ſpinoſa trifolium Indica arbor dicta.* The Indian Corall tree.

which are ſet in the like manner with the other, with an odde one at the end, and ſome not, but are ſomewhat ſhorter and rounder: we have not ſeene the tree to beare any flowers with us as yet nor fruite, but the cods that came to us, were ſmall, long, and ſomewhat flat like unto the pods of *Laburnum* Beane trefoile, but longer thinner and blacker, containing ſmall grayiſh ſhining flat and round ſeede.

3. *Arbor ſpinoſa Indica muricatis ſiliquis.* The prickely codded Indian tree.

The ſeede taken out of the prickly huskes of a tree that was brought from the Weſt Indies, was ſowne by Maſter *George Willmer* at *Stratford Bow*, and roſe up that yeare to be three or foure foote high, branched forth on all ſides, and ſet with ſmall ſharpe crooked thornes, both on the maine ſtemme and branches, having ſundry winged leaves ſet on them, very much reſembling the laſt *Virginian* Locus. I can give you no further relation hereof, in that the plant periſhed in the next Winter after the firſt ſpringing, for want of ſuch due keeping as was fit for ſuch tender plants, that come out from warme Countries: The figure of the prickely huske or pod, you may ſee ſet on the ſide of the figure, with the grayiſh peaſe taken thereout alſo, which was as hard as a ſtone, with a white kernell within them, yet not ſinking in the water.

4. *Siliquoſa & ſpinoſa trifolia Indica Coral arbor dicta.* The Indian Corall tree.

Cluſius firſt, and ſince him *Baptiſta Ferrarius* by the ſight thereof, growing both at *Rome* and in *Spaine*, hath enlarged the deſcription of this tree, which I will contract into one, and tell it you thus. It riſeth up with many ſtemmes, whoſe younger barke is ſmooth and greene, the elder paler and more rugged, ſpreading fairely with branches, armed with ſmall crooked whitiſh thornes, and with faire broad freſh greene and almoſt round leaves, like unto thoſe of *Arbor Iuda*, *Iudas* tree, but that they end in a point, whoſe footeſtalkes alſo as *Cluſius* hath expreſſed, have the like crooked thornes on them, which leaves are three alwayes ſet together, the two loweſt oppoſite on ſhort footeſtalkes, the end one on a longer: the flowers are Peaſe faſhion, or like thoſe of *Phaſeolus* the Kidney Beane, of an orient red colour like Corall, of which colour alſo are the Beanes or fruite in pods, like unto other *Phaſeoli*: it is very tender to keepe, not abiding the leaſt cold aire, for as *Cluſius* ſetteth it downe *Signior de Tonar*, the chiefeſt Phyſitian of *Seuill* in *Spaine* in his time, having two trees hereof growing, which by one Winters oversharpeneſſe had them both ſpoyled therewith. I have not altered the name hereof, whereby it is generally knowne, but if I might adopt one, as I thinke more fitting thereunto, I would entitle it *Phaſeolus arboreus ſpinoſus Indicus flore coralino*.

The Place and *Time*.

All theſe foure ſorts came from the ſeverall part of *America*, but we cannot tell you where diſtinctly, for the two laſt, but the firſt it is likely came from *Canada*, the *French* plantation, and the ſecond from *Virginia*: The flowring and ſeeding is likely to be at the time of other trees at the Spring and Fall.

The

The Names,

The firſt as I ſaid *Conutus* calleth *Acacia Americana*, ſuch a glorious title doth he ſet upon ſo unbeſeeming a Plant, I have put *Robinus* name thereto, becauſe it is generally called *Acacia Robini*. The ſecond is called Locus by our Nation reſident in *Virginia*, The third came to us without name, but it is likely to be the *Bonduch Indiano*, of *Pona* in his *Italian Baldus*, which he referreth to *Cluſius* his firſt ſtrange fruite in the 30. Chapter of his ſecond Booke of Exotickes, as alſo to the firſt in the 15. Chapter of his third Booke. The fourth was firſt ſet forth by *Cluſius* in his Appendix to his Hiſtory of Plants, ſent him by *Tovar* out of *Spaine*, and enlargeth the deſcription thereof, eſpecially of the flowers in his ſecond Appendix: *Baptiſta Ferrarius* in his *Flora*, or *de florum cultura* ſetteth it forth bravely, but without flowers; as having not as then ſhewed them.

The Vertues.

None of theſe have beene tryed to what grieſe or diſeaſe they are a remedy, but onely the third, which if it be *Pona* his *Bonduch*, as I am certainely perſwaded it is, then he ſaith, theſe particulars are attributed unto it to ennoble it: The *Egiptians* in *Alexandria* account it the guardian of their children, in tying it about their neckes, to defend them from all evill chances; to preſerve one from the venome of the Scorpion, to helpe the Megrime by taking ſome of the pouther into the noſe, and the torture or writhing of the mouth, is availeable alſo againſt the falling ſickeneſſe, by taking the quantity of two Pepper cornes at a time: the quantity of a Cich Peaſe taken in Wine helpeth the chollicke and the quartaine ague, is a remedy for any poyſon, which ſaith he I have not yet tryed: the fruite ſaith he was ſent from *Conſtantinople*, and theſe Vertues affirmed to be in it, and there eſteeme it of great worth.

CHAP. CII.

Goſſipium. The Cotton tree or plant.

I Have foure ſorts of Cotton trees or plants to ſhew you that have come to our knowledge, or that we can be aſſured of, although *Bauhinus* ſaith there is one with a white ſeede, which is his firſt, whereof I never heard or read, and is likely to be miſtaken, for all thoſe Authours that he doth cite for it, doe all intend the annuall Cotton, whoſe ſeed is in lumpes, and blacke.

1. *Goſſipium arboreum.* The tree of fine Cotton.

This Cotton riſeth up with a wooddy ſtemme, to be nine or ten cubits high, ſpreading wooddy branches, and many broad greene leaves on them, parted on the edges into three or five diviſions, ſomewhat like a Vine leafe, but ſofter and whiter, at the ends of the ſmaller ſprigges come forth the flowers, two or three at a place, but

1. *Goſſipium arboreum.*
The tree of fine Cotton.

2. *Goſſipium fruteſcens anomum.*
The buſh or Lumpe Cotton.

each

3. *Gossipium Indicum spinosum.*
Thorny Indian Cotton.

4. *Gossipium Iavanense longifolium.*
The long leafed Cotton tree of *Iava.*

each upon a ſlender footeſtalkē, ſet in a broad huske of two leavēs, very much jagged at the toppes, and containing therein a large yellowiſh flower, ſomewhat like a bell flower, broad above and ſmall at the bottome, parted to the bottome into five very thinne leaves, with a ſtiffe reddiſh middle pointell, compaſſed with five or ſixe yellow threds, which is thruſt of by the fruite, riſing under it, and growing to bee a ſmall round head or ball, covered with a hard skinne, which opening when it is ripe, ſheweth forth a lumpe of pure white wooll, having divers ſmall blackiſh ſeede, of the bigneſſe of Pepper cornes, but not ſo round, lying diſperſedly through the lumpe, and ſingly but one in a place, with a ſweet whitiſh kernell within them, the roote diſperſeth under ground and abideth, not periſhing nor loſing the branches as the next doth.

2. *Goſſipium frutescens annum.* The buſh of lumpe Cotton.

This Cotton is yearely ſowne, even in the warmeſt Countryes of *Aſia minor*, and within foure monethes or little more is gathered againe from the ſowing, ſhooting an upright ſtemme, nothing ſo wooddy or great as the former, but brancheth forth divers wayes, ſet with large and broad ſoft leaves, like the former, and parted alike, the flowers alſo ſtand in the like manner, and yellow, with purple bottomes, with huskes of fine leaves under them, after which commeth the fruite like it, but ſet in a ſhorter, ſmaller, thicker, and harder rough blackiſh huske parted into three cells, with whitiſh hard ſhining skinny or wooddy partitions on the inſide, containing each of them a round ball of fine white Cotton, With a lumpe or bunch of greater blacke ſeedes by the halfe, in the middle, ſticking cloſe together in two rowes, with white ſweete kernells within them: The roote as I ſaid is annuall, and periſhing as ſoone as it hath perfected the ſeede.

3. *Goſſipium Indicum ſpinoſum.* Thorny Indian Cotton.

This kinde of Cotton hath a ſtemme about three cubits high, ſet with ſmall prickes, and having many fairē broad leaves ſet thereon upon long footeſtalkes, divided into ſeven parts, ſomewhat like thoſe of *Staviſacre*, the flowers are like to Bell flowers with five corners, the Cotton is very fine, and the ſeedes are ſomewhat like the Thorny Mallow.

4. *Goſſipium Iavanenſe longifolum.* The long leafed Cotton of *Iava.*

This as *Cluſius* relateth it from *Franciſcus Rodorigues*, native of *Bengala*, groweth on a great high trēe, with many farre ſpread armes and boughes, and ſtored with long and narrow leaves, neerer reſembling Roſemary then Willow leaves, but that they are much longer, whoſe fruite was like a long pod of ſixe inches long, and five in compaſſe, growing great from the ſtalke upwards, opening and ending in five pointed parts, whoſe skinny barke was of an aſh colour, and rugged, but full of moſt pure white ſoft wooll, and divers blacke round ſeedes within, not involved with the Cotton like the reſt, but growing by themſelves upon fine long wooddy partitions, extended all the length of the cod: the wooll or Cotton was ſhorter then of the other, and not fit to be ſpunne into thred to make cloath, for the Natives uſe it not to that purpoſe, but put it to another uſe, namely to ſtuffe cuſhions and the like, being ſofter then any wooll, cotton, or feathers.

The

The Place and *Time.*

The first groweth not naturally in all the lesser *Asia*, but as *Alpinus* and *Bellonius* and others say in the greater *Asia*, and *India*, and *Brassill* also, and *America*, and brought into *Egipt* and other Christian Countries, but as a rarity: The second hath for many yeares beene planted in the severall Countries of *Asia minor*, *Phrigia*, *Cilicia*, and other the parts thereabouts, and in *Apulia* also, and in many of the Isles in the *Mediterranean* Sea, and sowne not untill the end of *Aprill*, and gathered againe in the end of *August* or in *September*, the third came out of *India* likewise, and the last from about *Bantam* in *Iava*, the former sort ripening the fruite somewhat more early then the other.

The Names.

It is called in Greeke ξύλον and ῥοδακινον, and so likewise in Latine, *Xylum* and *Gossipium*, and of *Serapio Coto*, and *Bombax*, as it is so also called in the Apothecaries shoppes: Some doe thinke and that not without good ground of reason; that the *Byssus* of the Auncients, is this first Cotton, from whence was made the *Byssina tela*, the fine white Callico cloath that commeth out of the East Indies: All Authours call them in generall *Xylum* or *Gossipium*, and the first *Gossipium arboreum* by *Alpinus*, and by the *Egiptians* as he saith, *Gotne mseglar*, it is more likely that *Bellonius* meant this tree by his *Arbor lanifera*, then that of *Clusius* in his Exotickes brought out of *Iava* and fittest for cushions, and *Gossipium perenne arboreum sive Asiaticum*, and *Brasilianum* by others. The second is called *Gossipium herba*, to distinguish it from the former, *Bauhinus* calleth it *Gossipium frutescens semine albo*, for sure he can meane no other sort, citing those Authours that he doth, who all I think say it is black. The third is extant only in *Pona* his *Italian Baldus* by the name of *Bombage Indiano*, that is *Gossipium Indicum*. *Bauhinus* calleth it *Gossipium arboreum caule spinoso*, and saith the seede is in lumpes like the ordinary sort, when as *Pona* himselfe saith it is like the seede of *Subdarifa*, that is, the thorny Mallow, and pictureth the seede like thereunto, at the side of the figure, and is not like the lumpe sort. The last *Clusius* mentioneth in the foure teenth Chapter of his first Booke of Exotickes, calling it *Arbor lanifera peregrina*. *Bauhinus* that he might say somewhat, referreth it to the *Cyla* of *Oviedus*, and questioneth whether it be not *Bellonius* his *Lanigera arbor*, calling it himselfe *Gossipium Iavanense salicis folio*. The *Arabian Serapio* as you heard, calleth it *Coto*, and *Bombax*, and others *Algudon*, as the *Spaniards* doe; the *Italians Bombagia*, the *French Cotone*, the *Germans Baumwool*, the *Dutch* and we Cotton, and Cotton woull.

The Vertues.

The kernells of the seedes is used to lenefie the hoarsenesse of the throate, and to helpe those that are shortwinded, to open the passages, and for those that have sharpe distillations on their lungs, and for coughes, to make the flegme the easier to be expectorated, and encreaseth sperme also: it is used also in gripings, and gnawings of the stomacke, yea though they come by poyson, and are good also in all hot agues, the Cotton it selfe is hot and dry, and being burned stancheth bleedings in wounds wonderfully: the oyle drawne out of the seed doth smooth the skin, and taketh away spots and blemishes therein.

CHAP. CIII.

Arbor Iudæ. *Iudas* tree.

Arbor Iudæ. Iudas tree:

OF the *Iudas* tree there hath beene observed two sorts, one with crimson, and the other with white flowers.

1. *Arbor Iudæ flore purpureo.*
Iudas tree with crimson flowers.

This tree riseth up sometimes to be high, and of a good size, and sometimes to be but as an hedge bush, spreading armes and branches, covered with a blackish red barke, the leaves that come forth upon the young reddish branches one at a place, are large and round, greater, but thinner then the leaves of *Asarabacca*, of a whitish greene colour on the upper side, and grayish underneath, falling away in Autumne: the flowers grow not at the ends of the branches, but at the joynts, and sometimes out of the very body, many standing together upon a long footestalke, of a fashion somewhat likeunto Peafe blossomes, of an excellent deepe crimson colour, after which follow sundry long flat and large thinne cods, of a reddish browne colour, with flat blackish browne hard seede within them: the roote groweth deepe and spreadeth farre.

Virginia. Of this sort there is one growing in *Virginia*, not differing from it in any thing, that I can as yet perceive.

2. *Arbor Iudæ flore albo.*
Iudas tree with white flowers.

This other groweth as great as the former, but with a whiter barke, and the branches greene, the leaves and flowers are like for forme, but of a white colour, and the cods after them; nothing so browne as in the former, and the seed likewise paler.

The

The Place and *Time.*

These kindes grow in *Narbone* and *Provence* in *France*, and in *Spaine* and *Italy* in many places: the flowers generally appeare before the leaves breake forth, yet bringeth not the cods to maturity in our Country, yet we have had them growne large and very reddish, but contained not any ripe seed within them.

The Names.

It is not certainely knowne that either *Dioscorides* or *Theophrastus*, have made mention of this tree in all their Workes, for although some have taken it to be that *Colytea* of *Theophrastus*, which he mentioneth in his third Booke and foureteenth Chapter, but unto this he attributeth a leafe like unto Willow, which this is utterly unlike, others againe, that is, those of *Mompelier* as *Clusius* saith, unto that *Golytea* of *Ida*, that *Theophrastus* mentioneth in the seventeenth Chapter of the said third Booke, whereunto he attributeth the leafe of the larger leafed Bay tree, but larger, rounder, and somewhat like the Elme leafe, yet somewhat long with all, greene above and whitish underneath, and whereunto saith *Clusius*, he in the foureteenth Chapter of the said third Booke attributeth cods, the descriptions of both which saith he, being contracted into one, agree well unto this *Arbor Inde*: but by *Clusius* his leave, this cannot hang together; for although they in both those Chapters, that is, the 14. and 17. are called *Colytea*; yet they are plainely distinguished by *Theophrastus* both in their leaves, the one like a Willow, the other like a Bay leafe, but rounder; and also in their fruite, that with the Willow leafe hath cods saith *Theophrastus* like unto Pulses: but that with broad Bay leaves, hath a *Chachrys* or *Amentum* as *Gaza* translateth it, and is said to be without flower or fruite, and besides hath yellow rootes: so that you may see plainely both those cannot be contracted to make one plant, their leaves being declared to be so divers: Some therefore would referre this tree unto the *Cercis Theophrasti* mentioned in two places, the one in the said foureteenth Chapter of his third Booke, where he saith it is like the white Poplar tree, both in greatnesse and whitenesse of branches, with the leafe of Ivy, &c. which *Clusius* thinketh is but an ample description of the third kinde of Poplar called *Lybica* the Aspen tree (which *Gaza* translated *Alpina*) the other place is in the first Booke and 18 Chapter, where he reckoneth *Cercis* to be one of those trees that beareth fruite or seedes in cods, as *Colutea* of *Lipara* doth, so that you see in this *Clusius* was also mistaken, as *Matthiolus* was also before him: but indeed this description of *Cercis* commeth nearest unto this *Arbor Inde*, of any other tree that hath beene likened unto it. Some have called this tree in Latine *Febago*, from the likenesse of the cods unto Beane cods, and some to be *Laburnum* or some kinde thereof; but the most currant name is *Arbor Inda*, yet *Clusius* calleth it *Siliqua sylvestris*, not as he saith, because it doth agree with the *Siliqua* of the Auncients, but because the *Spaniards* called it *Algarovo Loco* which is as much as *Siliqua fatua*, and those of *Castile Arbold amor*, the *French* call it *Guainier* because the cods are like knive sheathes, we have no other *English* name to call it by, then *Indas* tree, untill some other can impose a more apt for it. It is judged by many that *Matthiolus* his first *Acacia*, in his former editions, was but a counterfeit figure of this *Arbor Inde*, whereunto he caused thornes to be put to make it seeme the more probable.

The Vertues.

There is no remembrance of any Physicall property appropriate hereunto either by ancient or moderne Writers, nor hath any later experience found out any: but from *Virginia*, we heare they account the flowers to be an excellent sallat ingredient.

CHAP. CIV.

Vitis. The Vine.

THere is a wondrous great variety of Vines that are manured, as I have shewed elsewhere in my former Booke, some there are that grow wild, which shall be declared in this Chapter, with a recitall of some of the choysest of the other.

1. *Vitis Vinifera.* The manured Vine.

The manured Vine in places where it hath stood long, hath a great stemme as bigge as ones arme sleeve and all, spreading without end or measure if it be suffered, many slender weake branches, that must be sustained from falling downe, the young being red, and the old of a darke colour, with a pith in the middle, at the sundry joynts whereof, grow severall large broad greene leaves, cut into five divisions and dented also about the edges, at the joynts likewise against the leaves come forth long twining tendrels, clasping or winding about whatsoever it may take hold of: at the bottomes of the leaves, come forth clusters of small greenish yellow flowers, and after them berries, thicke set together in bunches of severall formes, greatnesse, colour and taste, in some the clusters are close, and others are more open, and some being round, others more long, and some tending to a square: some likewise are very small, as the Curran Grape, others great, and some a meane betweene both: some againe are white, others blacke, or blewish, or red, or parti-coloured, and for tastes, they are so variable that I cannot describe them, both sweete according to the severall climates they grow in, and sower or harsh, or mixt, more or lesse pleasant one then another, within which there are usually one two or three kernels: They that keepe their Vines in the best manner doe keepe them low, and cut them often, both Winter and Summer, whereby they grow the better, and take up lesse roome, bringing their Grapes both fairer and sweeter.

2. *Vitis laciniatis foliis.* The Parsely Vine or Grape with thin cut leaves.

This also groweth as other Vines doe, the difference chiefely consisting in the leaves, which are very much incised or cut into many parts, even almost to the middle, and dented, the Grapes which are white and great, are like unto the white Muscadine Grape, and of as good a relliſh, bearing great bunches, and ripening with the middle sort of Grapes.

3. *Labrusca sive Vitis sylvestris Europea.* The wild Vine of *Europe.*

The wild Vine in regard it is naturall, and therefore neglected, lyeth for the most part on the ground, and thereby is made lesse fruitefull, unlesse it meete with some hedge or tree, whereon it may clime, and then spreadeth as the

1. *Vitis Vinifera.*
The manured Vine.

Vitis Laciniatis foliis.
The Parſly Vine or Grape.

the manured, being both in branches, leaves, and tendrels, like unto the manured Vine, as alſo in bloſſomes, but beareth either little or no fruite, or ſeldome comming to ripeneſſe, and what it doth is ſmall and blacke, and no way comparable unto any of the manured Vines, being rather binding and ſowre then ſweete.

4. *Vitis ſylveſtris Virginiana.* The wild Vine of *Virginia*.

This one ſort of the Vines of *Virginia*, like all other wild ſorts runneth on the ground, and taketh hold of whatſoever it meeteth with, being in all things like the former wild ſorts, but that the Grapes are ſmall and white, and with little ſappe or juyce in them, and the kernell twice as bigge as others. There is another ſort that hath bigger blew Grapes, and ſowrer in taſte. A third they call the Foxe Grape, and hath a more rugged barke, a very broad leafe, without any diviſion almoſt but dented, and the Grape is white, but ſmelleth and taſteth like unto a Foxe.

Alba.
Cærulea.
Vulpina.

5. *Vitis ſylveſtris trifolia Canadenſis.* The wild Vine of *Canada*.

This wilde Vine of *Canada* groweth like unto other the wilde Vines of thoſe parts with ſlender reddiſh branches, climing where it can get whereon; but the leaves on them being little more then halfe ſo large as the manured Vine, hath onely three partitions in every leafe, but each cut in deepe, even to the long ſmooth ſtalke, whereon they ſtand, making them ſeeme as three leaves, which are of a darke greene colour, and ſomewhat thicke alſo: the fruite is like the other wild ſorts, having more skinne and kernell then ſubſtance or juyce.

The Chiefeſt Grapes are theſe:

The *Damaſco* white Grape, which is the true *Uvæ Zibebæ*, that the Apothecaries ſhould uſe in ſundry of their compoſitions.

The Muſcadine Grape both white and red.

The Frontignacke or Muske Grape.

The party coloured Grape.

The Raiſin of the Sun Grape.

The Curran Grape is the ſmall blew Currans that the Grocers ſell, and have no kernells, whereof there is another ſort that beareth red berries, almoſt as ſmall but not ſo ſweet, or rather a little tarter.

The ſmall earely blacke Grape.

The blacke Grape of *Orleance*.

There is a Grape without ſtones growing in ſundry places, as by the River *Soreke* neere *Aſcalon* in *Paleſtina*, giving a red wine, as alſo in divers places of *Arabia*, *&c.* and in the *Maderas*, *&c.*

There is reported alſo to be one that beareth greene leaves continually, yet yeeldeth fruite but at the time that others doe.

There is ſaid likewiſe to be ſome that beare twiſe in a yeare, and ſome oftener, having both ripe and greene fruite together at one time upon the tree.

The

The Place and Time.

The manured kindes are planted every where, and according to the soile and climate is both the rellish and strength of every sort, for the Vine that groweth in the *Canary* Islands, is the same with that at *Malaga* and *Sherin*, and yet the one still excelleth the other in strength and sweetnesse. The other wild sorts are all expressed in their titles: the first wild sort in sundry places of *Europe*, both *Italy*, *France* and *Germany*. The wild sorts flower somewhat later then the tame or manured, and therefore what fruite they beare, must likewise be later ripe then others.

The Names.

The manured Vine is called in Greeke ἄμπελος ἡμερος and ἥμερος, and in Latine *Vitis Vinifera*, and *sativa* or *culta*: the wilde is called ἄμπελος ἀγρία, and in Latine *Vitis sylvestris*: *Vitis a vino, vel quia invitetur ad uvas pariendas dicitur*, but there is another *Vitis sylvestris* of the Grecians, that is the *Clematis vrens* of the Latines by some, and the *Amaradulcis* by others, when as this is called *Labrusca*, to cause it to be knowne asunder: the juyce of the unripe Grapes of the manured Vine, or rather of the Grapes of the wilde Vine, which come not to ripenesse are called ὀμφάκιον in Greeke *Omphacium*, and *Agresta* in Latine, in *English* Varjuyce: The Grapes when they are dryed in the Sunne are called *Uvæ passæ*, and *Passule solis* Rasins: the juyce or liquour pressed out of the ripe Grapes is called *Vinum* wine: the kernels are called γλάγματα *acini*, the dregs or setling of the Wine, are called *Vini fæces*, Wine lees while they are moist, but being dryed is called *Tartarum*, *Tartar* or *Argoll*, the destilled Wine is called *Spiritus vini*, or *Aqua vitæ*, the spirit of Wine or *Aqua vita*. In the wild Vine the flowers are called ἀνάνθη, and *Oenanthe*, that is *Vini flos* in Latine, which was of much use in former times, but now is wholly neglected. The *Arabians* call the Vine *Harin*, *Karin* or *Karni*, the *Italians Vite viniferera*, the *Spaniards Vid* and *Parra*. The *French Vigne*, the *Germanes Weireb*, the *Dutch Wyn gaert oft Wynstacke*.

The Vertues.

The Vine hath in it divers differing and contrary properties, some cold, some hot, some sweete, some sower, some milde and some sharpe, and some moistening, and others drying: for the leaves and young branches are cooling and binding, and good to be put into lotions for sore mouthes, or other parts, and in drinkes against feavers: being bruised, and with Barley meale applyed to the temples easeth the head ache comming by heate; and applyed to the stomacke, easeth the inflammations; and heat thereof: the juyce of them being drunke stayeth the laske, castings, spittings of blood, and womens immoderate longings. The ashes of the burnt branches, or pressing, made into a lye and drunke, is very effectuall for the stone and gravell in the kidneyes: being mixed with a little vinegar, it consumeth the warts of the fundament, and the inflammation thereof being bathed therewith, it doth marvellously ease the paines, and taketh away the swelling. The said lye of Vine ashes, is good to wash places out of joynt, or burnt with fire, and used with Rue and vinegar, is good for the swelling of the spleene: and used with wine, it helpeth Saint *Anthonies* fire: the said lye also helpeth frettings and gallings in any place: the ashes made up with *axungia*, is good against hard tumours, clenseth fistulaes, and hollow ulcers, and healeth them up afterwards, helpeth the paines and shrinking of the sinewes, and being mixed with oyle easeth those places that are bruised by falls or otherwise, and cureth the bitings of Scorpions, and dogges: used with vinegar and niter, it wasteth away Wens and other excressences in the flesh. The water that droppeth from the Vine, when it is cut out of due time, being drunke helpeth to expell and wash downe the gravell and stone in the kidneys. The Gum that issueth out of it selfe sticking to the barke, being drunke in wine doth the same, (but that we seldome see any such in our country, and therefore may safely use the water in the stead thereof) and being bathed on the skinne taketh away scabbes, tetters, the morphew, and the leprous scurfe, if the places be first washed with niter: The said Gumme or the water that droppeth from the greene branches, when they are burned, being used with a little oyle taketh away haires and warts. The fresh Grapes being eaten, doe breede a little windinesse (which is incident unto all sorts of raw fruite) but stirre up the appetite, and are pleasant to the stomacke, helping to stay spittings of blood, but affect the head and the bladder: and are forbidden in agues: being hung up and dryed a little, or made into Raisins, they doe helpe to loosen the belly, especially if they be taken without the kernells, which are more drying and binding, to be taken in pouther of themselves then any other part of the Vine: Those which are called Rasins of the Sunne are the best for this purpose with us, and for any other use in physicke: and herewith are made Tisane drinkes, to helpe coughes, hoarsenesse of the throate, shortnesse of winde, toughnesse of flegme, causing it the more easily to be expectorate, and doe lenefie sharpe and nauseous humours, that offend the mouth of the stomacke: they serve likewise to open the obstructions of the liver, spleene and bladder, and taken by themselves they nourish much, by reason of their thicke sweete and temperate substance, whereby also they stay not long nor putrifie in the stomacke. The small Raisins or Currans are very nourishing likewise, and somewhat opening the belly, especially being stewed with some other things conducing thereunto, as with a decoction of Sema, Rubarbe, and other such like things, according as occasion shall neede: The *Damasco* Raisins have a little tartnesse in them, whereby they are most gratefull to the stomacke, and excelleth the Raisins of the Sunne for all the purposes aforesaid. The juyce of the Grape is of two sorts, that is, made of unripe Grapes which is called Varjuyce, or of the ripe Grapes called Wine: The Varjuyce is a fine tart liquour fit to be used in brothes, meates, or sawses, to sharpen the stomacke, to get an appetite, and to refresh and quicken fainting spirits: Of this juyce is made a syrupe of especiall use in the like causes: the Wine is of so many sundry sorts, as not onely the Grapes, but the severall climates and soyles wherein they grow are. The weake Wines are very rheumaticke, and clense much: the strong wines are very heady, and enflame the blood very much; those of a middle temper are most proper for our bodyes (who use not willingly or ordinarily, to allay or temper our wine with water, unlesse the Vintner doe it without our knowledge or consent) and most wholesome for our health, and most in use for Physicke, both to boyle in drinkes, and to serve as the *Vehiculum*, to extract the Vertues of whatsoever shall be steeped in it, And is distributed into many parts, for of it is made both *Sapa* and *Defrutum*, in *English* Cute, that is to say, boyled wine, and both made of *Mustum*, new Wine, the later boyled to the halfe, the former to the third part. Then there is *Lora* which is a small kind of wine, like our small beere, by putting water to the pressings, and pressing them over againe, but because we have no use of such with us, I forbeare to speake further of it, *Acetum*, Vinegar, that is, sowre wine, which is as the other *ingenij non naturæ opus*, as *Pliny* speaketh of the former, for it is made by setting in the Sunne, which exha-

Sarmenta et folia. The branches and leaves.

Cineres clavellatæ & eorum lixivium. Vine ashes and the lye of them.

Lachryma vitis. The Vine water or bleeding.

Gummi. The gum.

Uvæ & Passulæ. Grapes and Raisins.

Acini sive Arilli. The Grape kernels.

Passulæ Corinthiacæ Currans.

Agresta sive Omphacium. Varjuyce.

Lora. Small Vine.

ling the purer ſpirits, and by the heate cauſeth the other to grow acide, and is of great uſe, both in health and ſickeneſſe, both in meate and medicine: but now adayes we have ſuch a baſtardizing, and falſification thereof,

Sapa Cute that we ſcarſe can get any right to uſe. The *Sapa* and *Defrutum* differing but onely in the manner of boyling, I may comprehend them both under *Cute*, and was deviſed to ſerve inſtead of hony, as *Pliny* ſaith, it helpeth the cough and ſhortneſſe of breath, and to expectorate tough flegme from the cheſt and lunges, it alſo eaſily paſſeth

Acetum Vinegar. through the belly, and maketh it ſoluble, Vinegar contrariwiſe is cooling and drying, as the *Cute* is heating and moiſtening, and therefore ſerveth to correct the heate in feavers, and to reſiſt putrefaction, it cutteth tough flegme, that is hard baked, and not eaſily brought up and ſpit forth: it is ſharpe and penetrating, and very uſefull in ſcabbes, itches, tetters, ringwormes, and fretting and creeping ulcers, to correct their malignity, and extirpate their corroding quality, but is offenſive to the ſinewes, by its pierſing and drying property, cauſing them to ſhrinke. But the deſtilled vinegar is of a more fiery and penetrating quality, which it gaineth by the deſtillation

Acetum deſtillatum Deſtilled Vinehar. thereof, the manner and order in this being quite differing from the deſtilling of Wine, wherein the pureſt and ſtrongeſt ſpirits doe firſt riſe and come forth, when as in vinegar almoſt two third parts are taken from it, which are the weakeſt, before the laſt and ſtrongeſt riſeth, but not the laſt which is the *Empyreuma*, and ſerveth even as the vinegar it ſelfe doth, but with more force, and as the *Vehiculum*, wherein the tincture and ſpirits of ſimple medicines are reſerved: But to ſpeake of Wine, from whence all theſe are made and derived, is to enter upon

Vinum Wine. a little ſea of matter: for to ſhew you all the ſeverall colours, ſents, ſtrength, ages, and taſtes of ſimple wines,

Vina compoſita ſive artificialia. Artificiall wines were too tedious and needleſſe alſo, and ſo is it likewiſe to ſhew you all the ſorts of compound or artificiall wines which are as infinite as the herbes, rootes, ſeedes, or other parts of them are, and take their names from the ſeverall ingredients that compound them, as for example Wormewood wine, Eyebright wine, Scammoniate wine or wine of *Squilles & ſic in infinitum*, as I may to ſay, each whereof hath the property of that herbe, roote, &c.

Partitas vti noſtri Septentrionalis. Our compound wines of Ale or Beere. that was put into it, while it was Muſt, that ſo they might worke together, but ſimple Wine being not made with us, theſe artificiall Wines are not in uſe with us, yet might be paralleld almoſt, if the things were put into our new Ale, or Beere, to worke in them, as wee uſe to doe with out dyet Beere. Yet other ſorts of compounded Wines might be made for ſundry phyſicall uſes, after the manner of our Hipocras wine, which is according to the ſpices put thereinto, cordiall and comfortable, &c Metheglin is a *Welſh* (ſtrange) drinke, not made of Wine, and therefore I would not reckon it among theſe Wines, being fit for ſome ſtout *Welſh* ſtomackes that affect it. The receipts of many whereof are extant in *Lobels* Appendix to his *Adverſaria*, whereunto I referre you. I will therefore touch onely the particuler properties of wine it ſelfe, both as it is medicinable and nouriſhing, for taken moderately, and by them that are of a middle age, or well ſtept in yeares, or are of a cold and dry diſpoſition,

Vinum Hippocraticum Hipocras wine. and (not very young, and ſo their blood too hot for to abide Wine) it encreaſeth blood and nouriſheth much: it procureth an appetite, and helpeth to digeſt being taken at meate, it provoketh urine and driveth forth raw humours thereby, ſtrengtheneth the vitall ſpirits, and procureth a good colour in thoſe that want it, or are maci-

Metheglin. lent, drawing to a conſumption, ſo as it be not accompanyed with a fever, it expelleth feares, cares, and heavineſſe, and breedeth alacrity, mirth, and bodily pleaſure, and by the moiſt warme vapours, cauſeth quiet reſt and ſleepe, both to the ſound and ſicke that lacke it; it likewiſe comforteth and warmeth all the cold infirmities of the ſtomacke, liver, ſpleene, and wombe, and helpeth windy ſwellings in the body, and generall evill diſpoſitions thereof, the greene ſickeneſſe, and the dropſie, and the over travelled, over wearyed body and minde, it is alſo the remedy againſt Hemlocke, Coriander, Poppy, and Opium, Wolfebane, Muſhromes; and Mandrake, or whatſoever cold poyſon or dangerous herbe, or roote is taken; Theſe be the effects of the moderate drinking of Wine: when as on the contrary ſide, the exceſſe thereof breedeth a diſtraction in the ſenſes, the Appoplexie, and Lethargy or drowſie evill, the trembling of the joynts, the palſie, and the dropſie, but is uſed to heale up old ulcers, and

Spiritus vini The Spirit of wine and *Aqua vitæ* ſores, no other moiſture being admitted in the cure. The ſpirit of Wine and *aqua vitæ*, were of ſo neere affinity in former times one unto another, that there was no more difference betweene them then betweene the ſtronger and the milder Wine, for *Aqua vitæ* being made wholly of Wine, with the addition of ſpices made the ſpirits to be the ſtronger, and the wine ſimply without ſpices to be the milder; but now there being not one droppe of Wine in the *Aqua vitæ*, is wholly deſtilled from the tilts or dregges of Ale or Beere, being their low Wines as it is called, and after diſtilled againe with a few Anneſeedes, or as ſome doe with a little Ginny Pepper, to make it the ſtronger without any other ſpice, commeth farre ſhort of thoſe auncient receites for the making of that which was good and wholeſome: to tell you therefore the effect of our *Aqua vitæ*, were not to tell any part of the nature or quality of wine, but of Barley and Hoppes, which make Ale and Beere, I will therefore ſhew you the properties of the ſpirit of Wine, which if you will transferre to *Aqua vitæ* you may, but to farre weaker effects: for hereby ſhall you know the goodneſſe and ſtrength by ſetting it on fire, with a paper lighted, the pure ſpirits burning fiercely, and will almoſt be wholly conſumed: the other burning but little, and leaving an inſipide and much watery part behind it: the purer therefore that it is, the ſtronger it is, and the leſſer of it to be taken at a time, and that not of it ſelfe, but in ſome Wine or other liquour, for feare of inflaming the blood and ſpirits, and chiefly upon ſymptomes and paſſions of the heart: and then taken with reſpect and good conſideration, it worketh much more effectually then the Wine it ſelfe doth, to all the purpoſes aforeſaid, in comforting and nouriſhing the naturall heate in elder perſons, giveth ſtrength and quickeneſſe to the ſences, and nerves, repaireth memory, and the cold and moiſt diſeaſes of the braine, helpeth the fainting and trembling of the heart, warmeth a cold and moiſt ſtomacke, helpeth digeſtion, expelleth winde from the ſides and belly, and all cold poyſons: being outwardly applyed to the temples, it eaſeth the paines in the head, and cold deſtillations, and the toothach, being gargled a little, and cicatriſeth all ſores, yet reſpect muſt be had, that it be not given where any feaver is, or where the diſeaſe proceedeth of heate, or is acceſſary thereunto, for feare of hardning the liver and ſpleene, and making chollericke perſons the more enflamed: Theſe ſpirits of Wine, as well as the Wine it ſelfe, ſerves as a *Vehiculum* or menſtrue, to draw out the tincture of divers things. And now laſtly to

Tartar or *Argoll.* ſpeake of the Lees of Wine, which being hardned is called *Tartarum*, *Tartar* or *Argoll*, and that which is taken from the whiteſt Wines is accounted the principall beſt for any medicine: but the red ſort ſerveth Gold ſmiths and others, to polliſh their ſilver, and Dyers in ſetting their dyes: the beſt white *Tartar* is either given of it ſelfe ſimply being made into pouther and taken, the quantity of a dramme at a time in ſome convenient drinke or broth, for ſome time together in dropſies or evill diſpoſitions of the body, to expell both by urine and ſiege, thoſe

wheyiſh

wheyish watery humours thereof, and applyed to womens brests that are over full of milke, doth dry them up, but the *Cremor Tartari* which is the purer part thereof, and especially if it be made as cleare as Cristall, (the highest worke of art in that kinde) doth worke more safely and more effectually then the *Crude Tartar* can doe: but this *Tartar* that is calcined untill it be white, hath then put of all purging quallity, and hath gained a causticke burning property, that will corrhode and eate away scabbed nailes and warts, and soone be brought into a salt, and will also soone be resolved into an oyle or liquour, if it be either laid upon a stone, or hung up in a linnen bagge, in a moist seller to be received as it droppeth downe, and is the most admirable *opifex* in Alchimy that ever was knowne, and not to be paralleld with any other thing, that I know; but to shew the operation of it in severall medicines by precipitation or otherwise, is not for this Worke, it must be sought out of those professed Authours of the *Spagyricke* Art, to whom I must referre you: There is another kinde of oyle of *Tartar*, of a farre milder temper and is more like unto a cleare water, which is very effectuall to cleanse the skinne from all manner of spots, scarres, morphew, or discolourings whatsoever, and maketh it smooth and amiable, and where there is cause to apply it, will helpe to bring on haire on the places decayed. The wild Vines are in property no lesse cooling, but more binding then the branches of the manured, staying the laske and spitting of blood, provoking urine, and pleasing to an hot stomacke, or that loatheth meat: the leaves hereof are as good for lotions, as of the other for sores in the mouth the privy parts and the fundament; the ashes of the branches are likewise used to cleare the eyesight of filmes, and what else may offend them, to cleanse sores and ulcers, and to take away the over growing skinnes of the nailes of the hands or toes.

Labrusca. The wild Vine.

CHAP. CV.

Berberis. The Barbery bush or tree.

THe Barberry bush shooteth forth many slender stemmes or stalkes from the roote, sometimes to a great heighth, covered with a smooth whitish rinde or barke, and yellow next the Wood, which is white easie to breake, and pithy in the middle, set full of sharpe small white thornes, and three at every leafe allmost, which are somewhat small and long, finely dented about the edges, and of a fresh greene colour: the flowers come forth at the joynts with the leaves, many standing on a long cluster, yellow while they are fresh, which turne into small long and round berryes, hanging downe in long bunches, upon a small stalke white at the first, but very red when they are through ripe, of a sharpe sowre taste, able to set their teeth on edge that shall eate them, the roote is yellow and spreading.

There is another sort, whose berryes are thrice so bigge as the former, not differing in any other thing.

Fructu majore. Absque arillis.

There is another also, whose berryes for the most part are without any stones or kernels in them, or but here and there some.

Berberis. The Barberry bush or tree.

The Place and *Time*.

It groweth in many of the woods in *Austria*, *Hungaria*, and in *France* also, the blossomes come forth in *May*, and the fruite is ripe in *September*, and *October*.

The Names.

It hath formerly beene held by very good and learned Authours, that this bush is the *Oxyacantha* of *Dioscorides*, and hath continued to this day, especially among the Apothecaries, yet *Cordus* accounted it an errour, and therefore would rather call it the *Oxyacanthos* of *Galen*, then the *Oxyacantha* of *Dioscorides*, and so doth *Camerarius* also, but we have shewed elsewhere what the true *Oxyacantha* of *Dioscorides* is, even the *Pyracantha* which hath ever greene leaves, and red friable berryes, neither of which can agree with this Barbary bush. Others againe have taken it to be the *Spina appendix Plinij*, but *Clusius* hath shewed the unlikelinesse of that opinion. *Matthiolus* and *Cesalpinus* call it *Crespinus*, because the vulgar *Italians* doe call it *Crespino*, and some thereafter in Latine *Uva crespina*, which some attribute to the Gooseberry, but many others doe call it *Berberis*, and so the generall vote goeth now adayes. The *French* call it *Espine vinette*, the *Germanes Erbsel*, *Sawracke*, and *Versing* the *Dutch Sawerboom*, and we in *English* Barberryes.

The Vertues.

The leaves of Barberries make a fine tart sawse like unto those of Sorrell, and serve to coole and refresh a fainting hot stomacke and liver, and repressing sowre belchings of choller, and is therefore good for aguish people: but the fruite is much more cooling and binding, quenching thirst, and restrayning chollericke and pestilentiall vapours, and is of very good use in either

of the agues of that nature, if the conſerve or the depurate juyce, or the ſyrupe thereof be taken with the ſyrupe of Violets: the ſaid juyce alſo or the berryes themſelves preſerved, is often uſed for thoſe that loath their meate, to procure an appetite, and repreſſe the force of choller, riſing from the liver thereinto, and that which paſſeth into the bowells procuring ſharpe laskes: it helpeth likewiſe to ſtay womens immoderate courſes, and if it be taken with a little Southernwood water, and ſugar, it killeth the wormes in the body: it is good alſo for thoſe that ſpit blood, and to faſten looſe teeth, ſtrengthen the gummes, and coole the inflammations of the palate and throat, and ſtayeth rheumes and deſtillations upon thoſe parts: it helpeth likewiſe to dry up moiſt ulcers, and to ſoder up greene wounds: the ſaid depurate juyce called wine of Barberyes, ſerveth to diſſolve many things chymically: the inner yellow barke of the body, branches or roote is with good ſucceſſe given to thoſe that have the yellow jaundiſe being boyled and drunke: *Cluſius* ſetteth downe a ſecret that he had of a friend, which is, that if the yellow barke were laid in ſteepe in white wine for the ſpace of three houres, and afterwards drunke, it would purge one very wonderfully.

CHAP. CVI.

Uva criſpa ſive Groſſularia. Gooſeberryes.

THere are ſundry ſorts of Gooſeberryes, chiefly varying in the fruite, ſome being larger or ſmaller then others, ſome red ſome greene or yellow, ſome blew, ſome round, ſome long and ſome ſmooth, and ſome hairy or prickely, which although I have ſhewed them elſewhere, yet it ſhall not be amiſſe, to remember them here againe.

1. *Groſſularia vulgaris.* The common Gooſeberry.

The common Gooſeberry buſh ſeldome riſeth up to the height of a man, with a ſtemme as big as ones thumbe, or more, at the lower part, covered with a ſmooth darke coloured barke, cleere of thornes thereon, and ſo likewiſe for the moſt part on the elder branches, or with a few onely, but the younger are whitiſh, armed with very ſharpe crooked thornes, which no bodies hand can well avoid that toucheth them, whereon grow ſmall cornered greene leaves, cut in on the ſides, but broad at the bottome next the ſtalke: the flowers are ſmall, and grow at each of the leaves, one or two together, of a purpliſh greene colour, hollow and turning up the brims a little: after which follow the berryes, bearing the flowers on their heads, and are of three ſorts, that is ſmall, or great that are round, or that are a little longer then round, greene before they are ripe, and with a thicker skinne then the other, but of a greeniſh yellow colour when they are ripe, ſtriped in divers places, cleere and almoſt tranſparent,

fructus ver.

1. *Uva criſpa ſive Groſſularia ſylveſtris.* The common Gooſeberry.

2,3. *Groſſularia rubra & cærulea.* Red and blew Gooſeberryes.

with

with ſmall blackiſh ſeede lying within the pulpe, which is of a pleaſant winy taſte, acceptable to the ſtomacke, and without offence, although one doe eate many of them: the longer berry hath the thicker skinne, and the worſer taſte.

2. *Groſſularia rubra.* Red Gooſeberryes.

The rēd Gooſeberry is of two or three ſorts; one hath ſlenderer ſtemmes and fewer thornes on the younger white branches, which bend downe more then the former: the leaves are made after the ſame manner, but a little larger, the flowers and berries are like the other, but are of a darke browniſh red colour, almoſt blacke when they are through ripe, of a fullſome ſweetiſh taſte, and never beare many in a yeare, which make them the leſſe regarded: Another ſort is like the former in growing with little difference: onely the berries are ſmaller, redder, and of a pretty tart taſte, and ſweet withall: A third ſort groweth very like the ordinary ſort of yellow, both in heighth, branch, and leafe, the berries are as large as the largeſt ſiſe of the other, and of a very fine red colour, untill they be ſuffered to hang long on the buſhes, which then are of a darkiſh red colour, very pleaſant in taſte. 1. 2. 3.

3. *Groſſularia cerulea.* The blew Gooſeberry.

The blew Gooſeberry riſeth up to be a ſmall buſh, having broader and redder leaves at the firſt ſhooting out, then the ſecond red Gooſe berry, the berryes are more ſparingly ſet on the branches alſo, and for bigneſſe neere unto the ſmall red Gooſeberry, but leſſer, and ſomewhat ſweete, and of a blewiſh colour like a Damſon, before the colour be wiped off.

4. *Groſſularia viridis hirſuta.* The hairy or prickely greene Gooſeberry.

This greene Gooſeberry is very like unto the ordinary Gooſeberry, in ſtemme and branches, but not furniſhed with ſuch ſharpe prickles as it, the younger branches alſo have ſmaller greene leaves: the flowers are alike, and ſo are the berryes; of a middle ſize, but greene when they are through ripe, with a ſhew of ſmall haires or prickes on them, which yet are as harmeleſſe as if there were none, but of a more pleaſing reliſh then any of the other: the ſeede hereof hath produced buſhes bearing ſmooth berries, with few or no haires on them.

The Place and *Time.*

The ordinary ſorts grow uſually in the hedges, in ſundry places of *France*, but I thinke rather planted there for defence onely, rather then that they are naturall to the Country, for even there as well as here, they are planted in Gardens and Orchards alſo: all the other ſorts likewiſe are kept in Gardens: they all flower very earely in the Spring, preſently after the leaves begin to come forth, and the berries are ripe from the middle of *Iuly* to the end of *Auguſt*, or as the yeare proveth.

The Names,

It cannot be certainely knowne that any of theſe fruites were knowne to any of the ancient Greeke or Latine writers, for although ſome have referred ſome of them unto the ἴσως or ὄτος *Ilos*, or *Oeſos* of *Theophraſtus*, whereof he ſaith one hath a white flower and fruite, and another both blacke, yet he remembreth no thornes in it, as that hath, which ſo curious a Writer would not have omitted, and therefore is not likely to be this: ſome againe would have it to be *Vitis precia* of *Pliny*, but that cannot be, becauſe he numbreth it among the other ſorts of Vines, that beare wine as one of them: *Geſner in hortis* taketh it to be the *Ceanothus ſpina* of *Theophraſtus*, but *Anguillara* rather judgeth his *Ceanothos* to be a kinde of Thiſtle, whereof we have entreated among the Thiſtles: it is called *Uva criſpa* by divers, and *Uva criſpina*, becauſe the leaves ſeeme to be criſpt or curld, and *Groſſularia* by others, becauſe they are like *Groſſos* ſmall greene Figges, and by ſome alſo *Uva marina*, but I know not upon what cauſe. The *Italians* call it *Uva ſpina*, the *Spaniards Uva creſpe*, and *Eſpina*, the *French Groſelles*, the *Germanes Kruſſbeer*, and *Kruſelbeer*, the *Dutch Stekelbeſien Kruſelen*, and *Crocſbeſien*, and we in *Engliſh* Gooſeberries, but in ſome places Feaberries, and Wineberries.

The Vertues.

The greene and unripe fruite of thē ordinary ſorts are ſomēwhat ſharpe and tart, and ſerve to reliſh brothes for the ſicke (as neede requireth,) as well as the ſound to ſtirre up a fainting or decaying appetite, or overcome with chollericke humours, but otherwiſe yeeld ſmall nouriſhment to the body, and that but cold and crude, for they doe a little helpe to binde the belly and ſtay fluxes of blood in man or woman, and ſtay their longings; yet they are not to be tollerated to cold or windy ſtomackes, leaſt by breeding more winde they bring the chollicke, and griping paines in the belly: the juyce of the berries or of the leaves, is helpefull to coole and reſtraine hot ſwellings and chollericke inflammations, called Saint *Anthonies* fire: the ripe fruite is more pleaſant, and more deſired for the ſweeteneſſe to be eaten at pleaſure, then for any proper or ſpeciall effect for any diſeaſe, but by reaſon of their good and ſweete reliſh, and moiſt lubricity, they eaſily deſcend out of the ſtomacke without any offence at all.

CHAP. CVII.

Ribes fructu rubro, albo, nigro. Red, white, and blacke Currans.

THe ſtemme or ſtocke of the red Curran buſh, hath a very thinne browniſh outer barkē, and greeniſh underneath, and of the bigneſſe of a good great ſtaffe, wholly without thornes on any branch, whereon grow large cornered blackiſh greene leaves cut in on the edges into five parts ſomewhat like a Vine leafe, but a great deale leſſe, the flowers come forth at the joynts of the leaves, many together on a long ſtalke, hanging downe about a fingers length, of an herby colour, after which follow round berries, greene at the firſt, and of a cleere red colour when they are ripe, of a little pleaſant and tart taſte withall, wherein lye ſmall ſeed: the roote is woddy, and ſpreadeth diverſly.

There is another ſort hereof, whoſe berries are twiſe as bigge as the former, and are of a better reliſh. *Fructu rubro maiore.*

The white Curran buſh hath a taller ſtraighter ſtemme, a whiter barke, ſmaller leaves, and ſuch like berries upon long ſtalkes, and of the ſame ſiſe and bigneſſe with the firſt or moſt ordinary, but of a ſhining tranſparent white- *Ribes alba*

1. *Ribes fructu rubro majore.* The greater red Currans.

2. *Ribes fructu albo.* White Currans.

whiteneſſe almoſt like Pearles, the ſeed within them being plainely to be deſcerned as they hang on the buſhes, and of a more pleaſant winy taſte, much more acceptable then the former. And is called *Gozel* as I am informed, in ſome places of *Kent*.

The blacke Curran riſeth higher then the laſt, more plentifully ſtored with branches round about, and more pliant alſo, the younger covered with a paler, and the elder with a browner barke: the leaves are ſomewhat like the former but ſmaller, and often with fewer cuts or deviſions therein, the flowers alſo are alike, but of a greeniſh purple colour, which turne into ſmall blacke berries like the former: both leaves and fruite have a kinde of ſtrong evill ſent, but yet are wholeſome, although not ſo pleaſant as any of the former, and eaten by many.

3. *Ribes fructu nigro.* blacke Currans.

The Place and *Time.*

All theſe ſorts have beene found growing naturally wild, ſome in *Savoy*, and *Switzerland*, as *Geſner* ſaith, and ſome in *Auſtria* as *Cluſius* ſaith he obſerved: the white ſort is not knowne, or at leaſt recorded by few, but kept in Gardens as the more rare ſort and laſt knowne to us. They flower and fructifie at the ſame time with Gooſeberries but abide longer on the buſhes before they fall or are withered.

The Names.

The name of *Ribes* and *Ribeſium frutex* is generally given to theſe plants for ſome likeneſſe, not onely in the leaves, but much more in the properties to the *Ribes* of *Serapio*, which as he ſaith hath reddiſh greene tendrels large round greene leaves and berries, whoſe taſte is ſweete with ſome tartneſſe, and are cold and dry in the ſecond degree: This is the deſcription of *Serapio* his *Ribes*, and although all doe generally conſent it is not that of *Serapio*, as not having tendrels nor large round leaves, yet is it generally received in the ſtead thereof, onely *Dodonæus* would frame it into the ſame mould, but I doubt his skill is too weake, and his allegations too much wreſted or too ſelfe conceited. Some have thought this to be more anſwerable unto *Theophraſtus* his *Iſos* becauſe this hath no thornes as the Gooſeberries have as *Lobel* doth alſo. But *Bellonius* in his Booke *de coniferis arboribus*, and *Rauwolfius* doe both ſay they found the *Ribes Arabum* on the mount *Libanus*. *Bellonius* deſcribeth it with ſixe or ſeven leaves of a Docke, but greater and rounder, riſing from the roote, and with red berries hanging downe in cluſters, comming out from the middle of a leafe, like as the *Ruſcus*, and *Laurus Alexandrina* doe. *Rauwolfius* faith

faith, he found it onely with two large round leaves like unto the *Petasites*, from whose stalkes a sowre juyce is pressed that is pleasant, and used of the richer sort; whereof because we have no further knowledge, we here leave them *Gesner* calleth this *Ceanothus levis*: most doe account it a kinde of *Grossularia*, and therefore call it *Grossularia rubra*, and *Grossularia ultramarina*. *Clusius* only and *Besler* in *horto Eystetensi*, make mention of the white *Ribes*, and *Bauhinus* who calleth it *Grossularia hortensis margaritis similis*: The blacke sort is generally called *Ribes fructu nigro*, yet *Gesner in horto* sheweth that some would make it to be a sort of *Amomum*, and therefore called *Amomum falsum* or *Pseudoamomum*, and some *Pipirella* as *Lugdunensis* saith. The *Italians* call it *Vnetta rossa*, the *French Groiselles doutremer*, the *Germans St. Johans trenblin* and *Sant Iohans beerlin*, and *Keozbeer*, as *Gesner* saith, the *Dutch Besiekens over zee*, and we Red Currans, the white *Ribes* as I am given to understand, is called *Gozell* in some parts of *Kent*.

The Vertues.

The red and white Currans are good to allay the heate and fainting of the stomacke, to quench thirst, and to provoke an appetite, and therefore are safely permitted in hot and sharpe agues, for it tempereth the heat of the liver and blood, and the sharpenesse of choller, and resisteth putrefaction: it taketh away likewise the loathing of meate, and the weakenesse of the stomacke by much casting, and is good for those that have any loosenesse of the belly: *Gesner* saith that the *Swissers* about *Berne* where it naturally groweth, use it for the cough. The blacke Currans are used in sawses and so are the leaves also by many, who are well pleased with the taste and sent of them, although some doe mislike them for both.

EXOTICÆ, ET PEREGRINÆ PLANTÆ.

STRANGE AND OVT-LANDISH PLANTES.

CLASSIS VLTIMA.

THE LAST TRIBE.

CHAP. I.

Agallochum sive Lignum, Aloës.

ENTRING now into my last quarter, so to consummate this revolution, I must use another manner of Method, then formerly I have done in the precedent Tribes; for intending to shew you as well those Out-landish Plants, that are called spices and drogues in our Apothecaries shoppes, as other fruites and strange trees, growing in the East or West Indies, I would first perfect the more usuall Physical part of them in an Alphabeticall order and with them insert a few other, the more principall things, although not plants, or taken from them that are for the most part in our shops used in medicines, shewing the place and names of them all in a continued stile, and not in fractions, as in the foregoing parts.

Lignum Aloes, or the wood of the Aloe tree.

Αγαλλοχον ἡ Ξυλοαλόη *Agallochum* and *Xyloaloe* in Greeke, is called also *Agallochum sive Lignum Aloes* in Latine, and so in *English*, or the wood of the Aloe tree, is a drogue rare to be had, and of much worth: but (as it is with many other things that come out of the East Indies unto us) of small knowledge what it is, and where and how it groweth. For but that *Garcias ab Orta* saith, that the tree is like unto an Ollive tree, and sometimes greater, and that he had the branches of the tree brought him to see, but neither flower nor fruite, the places being very dangerous by the haunt of Tigers therein, we should not know what forme it bore; none of the Ancients either *Greekes* or *Arabians*, having set downe any thing thereof, although they have all mentioned it, and the choyce of the best, with the Vertues: onely *Serapio* in the 197. Chapter of his Booke of Simples, saith it beareth small berries like unto Pepper, but red: yet *Garcias* maketh some doubt thereof, as he doth of sundry other his relations in that Chapter. For although *Serapio* in that place reckoneth up divers sorts, and *Ruellius* speaketh of foure; yet *Garcias* saith, he knew but one true sort of *Lignum Aloes*, which grew in India, and that the other sorts that were so called, were but sweete woods assimulating it, but were not the true and right wood, which the *Arabians* call *Agalugin* and *Huud*, and they of *Surrat* and *Decan*, *Vd*, as it is likely from the *Arabians Haud*, which word with them properly signifieth but *Lignum* wood, and κατ' ἐξοχὴν, *præstantissimum*; but they of *Malacca* and *Sumatra* where the true groweth, call it *Garro*, and the best

Agallochum sive Lignum Aloes.
Lignum Aloes, or the wood of the Aloe tree.

Calambac

Calambac: yet as *Garcias* saith, that that sort of sweet wood that commeth from *Comorin*, and *Zeilan*, and there called *Aguila brava*, that is to say, *Lignum Aloes sylvestre*, is not true *Lignum Aloes*, which true sort as all the Auncient Authours doe set it downe, is a blackish wood in peeces, some accounting the greater peeces to be the better, but yet somewhat discoloured with veines, (some Authours saying it is so weighty and heavy, that it will sinke and not swimme being put into water: but others doe not allow of that note, saying that the best that is will swimme) and full of an oyleous substance, of a fine sweete and aromaticke sent, which it will sweat forth, when it is burned: Now to come to our later times and shew you, that for many yeares together (as many other such like rare drogues) true *Lignum Aloes* was not knowne to the Physitions or Apothecaries of *Europe*, for they used instead thereof a kinde of *Lignum Rhodium*, which *Ruellius* tooke to be *Aspalathus*, and but that the *Venetians* of late dayes by their travell and search, both in *Cairo* and the East Indies, caused some of the true sort to be sent unto *Venice*, and was upon view and tryall approved, the *Portugalls* Sea voyages to the East Indies, did first make it knowne in these later times to Christendome: but now in our Droguist and Apothecaries shops there is much variety and counterfeit stuffe obtruded on the ignorant, divers sorts being to be seene, and yet scarce one of them true *Lignum Aloes*, having those markes and notes formerly set downe, and acknowledged by the Ancients, which are the onely true notes whereby to know the best: and such no doubt is our best sort, which are knobbed or uneven peeces, very brittle, and breaking short, somewhat blacke on the outside, and more gray and discoloured within, of a very small sent, untill it be burned; yet I have seene with Master *Tradescant* the elder before he dyed, a great peece of true *Lignum Aloes*, and of the best sort, as bigge and as long as a mans legge, without any knot therein, which as he said our King *Charles* gave him with his owne hands, but was here kept before, and accounted by many, as a great religious rellicke, even to be a peece of the wood of that Crosse, whereon our Saviour was crucified, and therefore was fetched away againe from his Sonne, to be kept as a monument or rellicke still: but this is like all the other rellickes in the world, even meere Impostures, for assuredly if all those peeces of wood, that are or were to be found in the world, said to be parts of that Crosse, were all set together, they would goe neere to make one, yea many cart loads full: yet so fond and superstitious are men to beleeve lies rather then truthes, that they will rather kill the gainesayers, and thinke that therein they doe God good service, then be wise to see their errours. The other sorts which are smooth and plaine, with long graines, are no true *Lignum Aloes*, although so called, being neither of that worth in price, nor goodnesse in effect. The propertyes whereof are very cordiall for the heart, and comfortable for the head and braine, helping the memory, and warming and drying up the defluxions of rheumaticke humours on those parts, for it is hot and dry in the second degree, a little astringent and bitter, and of subtill parts, it much conduceth to weake livers and fainting spirits, and strengtheneth also a languishing stomacke, helpeth disentries or laskes, and the Pleurisie.

Although the subject matter of this whole worke is the description of Plants, and of no other things, yet I thinke it materiall to this Classis and among the other Physicall Drogues, to treate of a few others that are not so especially such as are best knowne.

CHAP. II.

Ambra Citrina. Yellow Amber.

YEllow Amber is called ἤλεκτρον by the Greekes, *Succinum* by the Latines, and *Carabe* by the *Arabians*, and in the Apothecaries shops, and is of sundry colours, some peeces being whitish, some yellow, paler, or deeper, and some of a very deepe red colour, and darke, all the other being cleere and transparent, but much more being polished: It is generally taken to be a kinde of liquid *Bitumen*, whose Springs and Fountaines are in the *Germane* Seas, and running into peeces, some greater and lesser then others, and is taken up with iron hookes, being soft under water, but hardning in the aire like Corall: that which is white, as being accounted the lighter and sweeter is the best for medicine, as the yellow for mechanicke uses, and being rubbed a little while, will then draw unto it strawes, and other such like small things, as the Loadstone doth iron, it will also burne like Rossin or *Bitumen*, with a strong heady sent, and the pouther thereof cast into the flame of a candle or other light, will make a sudden flash like lightening, and being so bituminous it yeeldeth an oyle, being destilled in a retort, which although at the first it is very red, and smelleth very fierce and strong of the fire, almost odious, yet by being sundry times re-distilled, it becomm'th so rectifyed, that both sent and colour is so farre amended, that it is then fit to be used. The Physicall properties of Amber are many, for being moderately hot and dry, being burned on quicke coales, the fumes received to the head, doe much helpe the moist destillations thereof on the eyes, teeth, nose, or stomacke, and is very convenient for those that have the falling sickenesse, to lessen their fits, and to restore them: it is good to provoke womens courses, and singular good to helpe the strangling of the mother, and helpeth women with child, both to goe out their full time with ease, and to hinder their miscarrying that are subject thereunto, to take halfe a dramme of the pouther in a reare egge, or in Wine three or foure mornings together, and this also helpeth them that have the whites, and men that have the gonorrhœa or running of the reines, constraineth the flux, and strengthning the parts very much, and is a certaine remedy for those that have their urine stopped many dayes together, causing it to avoid plentifully, being taken in Saxifrage water; it is also very good for old coughes, and those that are fallen into a consumption, to take the pouther thereof mixed with Conserve of red Roses in the mornings fasting, and is very availeable for joynt aches, and the running gout. The Chimicall oyle of Amber being taken inwardly, three or foure drops in a little Muscadine doth wonderfully ease the stone, and the stopping of urine, or strangury making it by droppes: two or three drops used outwardly on the temples, the nape of the necke, or behind the eares, doe warme and dry a cold moist braine, discusseth windes in the eares and head, and strengtheneth the memory, and is a singular helpe in all cephalicall diseases.

CHAP.

CHAP. III.

Ambergrisea. Ambergrise.

AMbergrieſe is better knowne to moſt by ſight what ſort is better then other, then what it is, or whereof it commeth: the opinions of Authours are very variable hereof, ſome ſuppoſing it to be the ſpawne of the Whale. others the recrement of long continuance in the belly of the true Whale (that hath no teeth and eateth ſoft fiſhes) which it calleth forth at certaine times, and by the agitation of the ſea is caſt on ſhore: ſome others take it to be the excrement of certaine great ſea fiſhes, and ſome to be the ſome of the ſea: all which opinions are utterly erronious, having no ſhew of truth in them: for although Amber in the *Ethiopian* language, ſignifieth a Whale, as well as Ambergriſe, and yellow Amber alſo, from whence roſe that vulgar opinion of being the ſpawne of the Whale, or becauſe that in the belly of a Whale (as *Monardus* relateth it) taken about the *Canary* Iſlands, there was neere an hundred pound weight of Amber found, but in an hundred more taken afterwards, was none at all found; Yet the moſt likely and certaine received opinion of the moſt judicious is, that it is a kind of *Bitumen* (as the yellow Amber is before ſaid to be, and therefore have both one name of Amber, being ſo neere one to another in their originall) whoſe ſpringes are in the Rockes of the Sea (or as ſome of the Auncients ſuppoſed grew on the Rockes, like Muſhromes on trees) condenſate into that forme and ſubſtance uſually obſerved, having that oylineſſe or unctiouſneſſe is in, it from it owne originall, and being light is carryed by the waves of the ſea, unto the ſhores of ſundry Countries and climates: *Ioſua Ferrus* relateth the originall thereof as of his owne knowledge, and that untill it hath attained the full maturity, it hath not that true ſent of Amber, as after, and ſaith that he had ſeene divers ſuch great peeces, that had not attained their true ſent. And although the *Ethiopian* coaſt, from *Mozamlique* and *Sofala* to the Iſlands of *Maldiva*, and beyond them to the Eaſt, doe moſt abound with Ambergriſe, yet are not the coaſts of the Weſt Indies in ſundry places without it, nor yet theſe of *Europe*, in ſeverall patts, and even our owne, and the *Iriſh* coaſts have yeelded it oftentimes, and in ſeverall peeces and quantity, yet neither ſo much nor ſo great as in other Countries: for *Garcias ab Orta* ſaith, the greateſt peece that ever he ſaw, was a peece of fifteene pound weight, but there hath beene ſeene as it is ſet downe by Authours, ſome peece well neere an hundred pound weight. For the choyſe thereof, ſeeing there is much variety in the colour, and ſome in the ſubſtance, as white more or leſſe, or gray lighter, or darker, or enclining to redneſſe or blackeneſſe: that which is not very white, as being uſually very dry, but grayiſh more or leſſe, and either with ſpots and veines, or without, ſo as it be fat, that is, upon a knives point, or ſuch like thing, heated will ſhew oylie, is accounted the beſt, having the peculier ſent belonging thereto, which is moſt neere unto dry cow dung, in my opinion, the blacke ſort is the worſt. The properties of Ambergriſe are theſe: it is hot and dry in the ſecond degree, it warmeth, reſolveth, and ſtrengtheneth, what way ſoever it be taken: it eaſeth the paines in the head, being diſſolved in a warme morter, and mixed with a little oyntment of Orenge flowers, the temples and forehead being annoynted therewith: it comforteth alſo the braine, warmeth and reſolveth the cold defluxions of humours thereon, and on the nerves and ſinewes: it doth likewiſe comfort and ſtrengthen the memory, the vigour alſo and ſpirits of the heart, it is ſingular good for women troubled with the mother, to be applyed to the place, it helpeth barrenneſſe proceeding from a cold cauſe: it is conducible to Epilepticke perſons, to ſmell often thereunto, which cauſeth their fits to be both leſſe violent and permanent: it doth moſt conveniently agree with aged perſons, to warme, comfort, and ſtrengthen their cold decayed ſpirits, adding vigour and luſtineſſe to them, and is accounted conducible to venereous actions.

CHAP. IV.

Amomum. Amomum.

EVen as I ſaid before of *Lignum Aloes*, and in the laſt Claſſis of the true *Balſamum*, ſo much more may be ſaid of *Amomum*, that the foregoing times for many ages had utterly loſt the knowledge thereof, and is yet to this day held doubtfull, as the *Balſamum* is, with many learned men, both in other and our owne Country, whether the right be to be found in *rerum natura* or no, and therefore formerly many did obtrude divers things for it, as the *Roſa Hiericutitina* by ſome, and *Peſ columbinus* by others, which is a kind of Cranes bill, called Doves foote, both which errors *Matthiolus* hath ſufficiently confuted, *Quatranius* alſo tooke the *Myrtus Brabantica* our Gaule to be it, and then as *Matthiolus* ſaith, a ſmall ſeed came to be taken for it, and therefore called *Amomum Germanicum*: but *Garcias ab Orta*, who lived many yeares in the Eaſt Indies, declareth that he ſaw a branch of *Amomum*, which the Phyſitions of *Nizamalucco*, the King of *Decan* gave him, being brought as they ſaid among other drogues out of *Aſia*, *Perſia*, and *Arabia*, for the Kings uſe, which as he ſaith, he found agreeable to *Dioſcorides* his deſcription there of, and withall was very like unto a Doves foote, and called *Hamama* by the *Arabians*, which ſignifieth the ſame thing, that is, a Doves foote: but both he and *Valerandus Donres* were deceived with the ſame thing, brought from *Ormus*, in being ſo taken there generally, & both the *Amomum* & *Amomis* are ſet forth in the figures by *Cluſius* in his *Scholia* on the ſame place in *Garcias* and here alſo. All theſe opinions and every of them are utterly falſe, and no way anſwering the truth of the thing, and *Dioſcorides* his deſcription: for of late dayes there hath been ſent to *Venice* from the Eaſt Indies, by one *Martinellus* a famous and curious *Italian*, in the ſearch of rare drogues, the true *Amomum*, which although it hath beene oppoſed by divers learned men, yet *Maronem* of *Padoa*, hath in a little treatiſe thereof, ſo exemplified it and comented upon every part of it, and comparing *Dioſcorides* with *Pliny* together, that it is now generally accepted of almoſt every where, to be the right and genuine thing, the deſcription whereof, I meane ſo much as was ſent, is on this wiſe: It is a bunch or cluſter of whitiſh round berries, ſomewhat like unto Grapes for the outward forme and bigneſſe, but elſe very like unto *Cardamomes* within, yet bigger and rounder, having within the outer whitiſh thinne ſhell or skinne, ſundry blackiſh browne ſeedes cloſe

thruſt

Amomum genuinum & ſpurium. True and falſe *Amomum.*

2. *Amomum aliud quorundam & Garyophyllum Plinij Cluſio ſuſpicatum.* Another ſort of baſtard or falſe *Amomum* ſuſpected by *Cluſius* to be *Pliny* his *Garyophyllon.*

thruſt together, very like to the inner ſeedes of *Cardamomes*, but larger and of ſomewhat a fiercer pierſing ſent, ſmelling ſomewhat like unto oyle of ſpike, which made *Cluſius* to thinke it had beene ſeaſoned therewith, and of a ſharpe hot and quicke taſte. The properties whereof are theſe: It is heating, binding, and drying, procuring ſleepe and reſt, and eaſing paines in the head, being applyed to the forehead, it digeſteth and diſcuſſeth inflammations and Impoſthumes, and helpeth thoſe that are ſtung by Scorpions: being uſed with *Baſſill*, it helpeth gouty perſons, and mervailouſly eaſeth the griping paines in the belly and bowels by reaſon of wind, to ſwallow three or foure of the ſeeds, and for the mother in women, taken in that manner, or made into a paſſary and ſo uſed, or elſe in a bath, it is convenient both for the liver and reines, and is an ingredient of chiefe account, in great Antidotes that are preſervatives. The falſe or baſtard *Amomum*, which as it is likely is the ſame that *Garcias* ſaith was held for true in the Indies, and which *Cluſius* ſaith in his Annotations upon that Chapter of *Amomum* of *Garcias*, *Valerandus Donres* received from *Ormus*, is by him thus deſcribed. They were like the toppes of ſome buſhes conſiſting of a number of ſmall branches, ſo thicke ſet with very ſmall leaves that ſcarſe any ſtalkes could be ſeene but leaves onely, ſomewhat like unto the ſtake with leaves of the ſea Spurge, the ends of them ſo cloſed that they did in ſome ſort reſemble a flower or Roſe, and the whole branches together, the foote of a feather footed Dove, from which likeneſſe it is probable aroſe the falſification, this had no ſingular good ſent or taſte to commend it. The very like hereunto ſaith *Cluſius* he received at *Vienna* in *Auſtria* from *Conſtantinople*, which they there uſed for *Amomum*.

2. *Amomum aliud quorundam & Garyophyllon Plinij a Cluſio ſuſpicatum.*

Another ſort of baſtard or falſe *Amomum* ſuſpected by *Cluſius* to be *Pliny* his *Garyophyllon.*

Becauſe this alſo hath beene by divers received for *Amomum*, and ſo ſent to our Drugiſts, I thinke good to adjoyne it therewith, for ſome reſemblance of the whole branch, although *Cluſius* ſetteth it with the Cloves, which as he ſaith it is ſomewhat like in ſent, but I thinke he referreth it to the Cloves, rather for *Pliny* his name of *Garyophyllon*, for in my ſent and taſte, it hath little affinity therewith, but yet hath ſome correſpondence with *Pliny* his briefe notes or deſcription thereof, and therefore I will give you *Cluſius* his figure and deſcription. *Iames Garret* while he lived, an Apothecary after he had beene a Druggiſt in *Limeſtreete London*, in the yeare ſixeteene hundred and one, ſent *Cluſius* ſome of this fruite as they grew, which were ſomewhat like Pepper cornes (but thoſe that I have by the name of *Amomum*, and I thinke are the ſame with his, are browner and bigger all for the moſt part, then any Pepper graine,) ſome bigger and leſſer, rugged and browne, and eaſie to be broken, which had blacke round ſeedes within them, to be divided into two parts, ſmelling as well as taſting like Cloves: this fruite or berries grow many cluſtring together like a bunch of Grapes, (each whereof hath a little crowne at the head, ſomewhat like an Hawthorne berry) two or three ſometimes together on a ſtalke: this had likewiſe ſome leaves ſtill abiding on the branch, and were of ſundry ſizes, although all of one forme, that is ſomewhat long and round, and round pointed, not dented at all about the edges, but ſmooth, and many veines therein, of a browniſh aſh-colour, and growing oppoſite on the ſtalkes. This is the cheife parts of his deſcription. We have not knowne it uſed for any diſeaſe, more then that being obtruded for *Amomum*, ſome more audatious then

wiſe

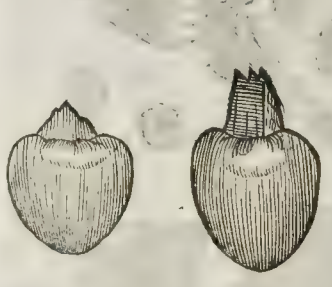
wise, have put in their compositions instead of the right, but by the taste as *Clusius* also noteth it, it might seeme to be availeable to many good uses if they were tryed.

CHAP. V.

Anacardia. Anacardes or *Malacca* Beanes.

Anacardium is a fruite like unto an heart, growing on trees plentifully in *Cannor* and *Calecut*, *Cambaya* and *Decan*, as *Garcias* saith, (and as some say on those mountaines in *Sicilia* that cast forth fire, but I somewhat doubt thereof) greater then our greatest Beane, and called by the *Portugals Fava de Malacqua*, of the *Arabians Balador*, and of the Indians *Bibo*, whose outer skin or huske is of a darke red colour, betweene which and the white edible kernell, lyeth a certaine liquour or viscous substance, of a fiery red colour while it is fresh, and of a sweetish, but somewhat hot taste, which is the true *Mel Anacardinum*, but instead thereof, because we cannot have them so fresh, that we might take forth this substance, some use to boyle the fruite being broken or bruised in honey, and then call it *Mel Anacardinum*, but of farre lesse effect. The whole fruite saith *Garcias*, is familiarly eaten while they are fresh, as also being pickled like Ollives, in all those parts where they grow, but as he saith, when they are dry, they use them as a caustick, to take away wens, &c. The qualities hereof are set downe by *Serapio* and *Avicen*, who although they make it to be of a delitery and poysoning property, by overheating and burning the blood, being hot and dry in the third, if not in the fourth degree, which *Garcias* beleeveth not; yet they say that the fruite helpeth the sences that are weake, and the memory that is decayed, and comforteth the braine, and nerves that are subject to the palsie that commeth through cold: *Garcias* saith that in India they use to give the whey wherein the fruite hath beene steeped, to those that are short winded, and to those that have the wormes.

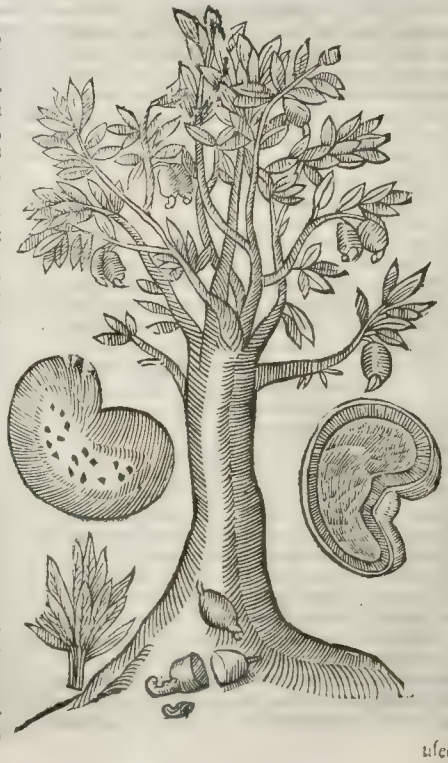
Anacardi. Anacardes or *Malutia* beanes.



CHAP. VI.

Cajous arbor cum suo & tenella planta.

Cajous. The *Cajous* or Apple Beane.



BEcause this fruite comming from *Brasill* and called by the people there *Cajous*, is in divers things like unto the *Anacardes*, I thought it not amisse to give you he knowledge thereof next thereunto, with the description of it, as *Clusius* hath recorded in his *Scholia*, on the *Anacardes* in *Garcias*, for I finde some other Authours to have made mention of it, as *Chri Tophorus a Costa*, *Lugdunensis*, *Linschoten*; *Baptista Ferrarius* who set forth a small plant thereof of one yeares growth, yet none have added any thing unto him. This tree (saith he) is great, having leaves like the Peare tree, but rather like Bay leaves in those that are new sprung up, thicke and of a pale greene colour: the flower is white like to the Orenge flower, but thicker with leaves, but not so sweet as they, the fruite is like unto a Gooseegge, both for forme and greatnes, of a very yellow colour, & sweet, full of a liquour like unto that of a Citron, that is called *Lima*, which is eaten by them with great delight, yet somewhat sharpe, and *Acosta* saith the same, and as it encreaseth the nut groweth lesse (although *Thevet* in the 61. Chapter of his description of *America*, contrary eth this manifest truth) not having any seed within it, but at the end of this fruite groweth forth this nut, which being put into the ground doth spring up like the stones or kernells or any other fruite, being of the fashion of an Hares kidney, of an ash-colour sometimes declining to redneſſe: this nut hath a double rinde, or shell betweene which is a certaine spongy substance, full of a most sharpe and burning oyle, the kernell within being as sweet as a Pistack nut, covered with a thin ash coloured skin, which is to be taken away, and is said to be a stirrer up of Venerious actions, and therefore

used

uſed by them, being firſt lightly toaſted: the ſharpe liquour or oyle is uſed by them againſt ſcabbes, and is good alſo for running tetters, and ringwormes. I have here given you the figure of the nut it ſelfe, and of the firſt yeares ſhooting of the tree, as *Baptiſta Ferrarius* hath exhibited it in his Booke *de florum cultura*. *Acoſta* further ſaith, that they uſe in the Indies to pickle them as they doe Ollives, and eate them to procure an appetite, to ſtay caſtings, and to helpe the weakeneſſe of the ſtomacke.

CHAP. VII.

Aniſum exoticum Phillipinarum Inſularum. A ſtrange Aniſeede like ſeede of the Indies.

WE can give you no knowledge of either roote leafe ſtalke, or flowers of this ſtrange plant, brought from King *Phillips* Iſlands neere unto *China*, and thereupon called *Phillippinas*) but of the toppes onely, with the huskes and ſeed in them, brought by Sir *Thomas Candiſh*, in his voyage of the Globes circum-navigation, and given to Maſter *Morgan*, Queene *Elizabeths* Apothecary, and to Maſter *Iames Garret*, of whom *Cluſius* received them, and giveth this deſcription thereof. It was a ſtalke with flat umbels of ſeed, as large as thoſe of *Archangelica*, and peradventure larger, ſuſtained by thicke footeſtalkes, and ſet round at the toppe, in a round forme one by another, conſiſting of ſixe, eight, or more huskes of ſeed, which were not parted in two like our ordinary Aniſeede, but each of them had divers round ſmooth ſhining aſh-coloured ſeed within them, like unto *Orobus*, the huskes were about an inch broad of a browniſh colour on the outſide and rugged, openning at the toppe into two equall parts, and although divers were empty, yet ſome contained ſuch ſeed as aforeſaid, the ſmell and taſte of them was very like unto Aniſeed, whereupon it was called Aniſe by them that ſent it: but Maſter *Garret* ſent the right name, whereby it was called in the Iſlands, one of them being brought along with them, who ſet the name in *China* Characters, which as *Cluſius* ſaith he could not imitate, but was *Damor*, every letter being written under the other downewards.

Aniſum exoticum Phillippinarum Inſularum.
A ſtrange Aniſeed like ſeed of the Indies.

CHAP. VIII.

Aſa dulcis & fœtida. *Aſſafetida* and the other *Aſa*.

ALthough I have ſpoken ſomewhat of *Aſa dulcis ſive odorata & Aſſafetida* in the Chapter of *Laſerpitium* among the umbelliferous plants, yet becauſe I ſaid but little of them there, reſerving them for this place, I will here entreate of them more largely. There is none of the ancient Authours either Greeke, Latine, or *Arabian*, that hath made any mention of *Aſa*, either *dulcis* or *fœtida*, but was firſt depraved by the Druggiſts and Apothecaries in forraigne parts, that in ſtead of *Laſer* ſaid *Aſa*, from whence ever ſince the name of *Aſa* hath continued, and afterwards divided into *Dulcis* or *odorata*, and *fœtida*, from the differing ſorts of goodneſſe pureneſſe and ſent thereof, when as they are both of a ſtrong ſmell, yet one much more then another, the *Aſa fœtida* being of ſo evill a ſent, that the *Germanes* call it *Teuffelz drech*, that is, *diaboli ſtercus*, Devils durt, and is very neere the ſent of *Storax liquida*, if it be not the ſame, relented and brought into a liquid forme, the foote or ſediment declaring it plainely, and is accounted with them to be ſweet, being of a ſtrong unpleaſant ſavour, rather then ſweet to us, ſo is the *Aſa dulcis & odorata*, called ſweete in compariſon of the other, called *fœtida*, becauſe being purer, it hath a more unpleaſant ſent and taſte. For as *Garcias* ſaith *Aſa* is called *Altihe* by the *Arabians*, which is the *Laſer* of the Greekes and Latines, as the plant being called by them *Anjuden*, and *Sulphium* by the Greekes and Latines, but *Jmgu* and *Imgara* by the Indians, the one when it is clenſed and purified from the droſſe being cleere and yellow as Amber, the other foule and impure, and are ſo familiarly eaten, as *Garcias* ſaith by the Indians, in their meates, brothes, and ſallets, and medicines, that they ſcarſe eate any thing, that is not ſeaſoned therewith, and is very pleaſant to them being uſed unto it, but loathſome to others, the richer ſort uſing the purer, and the poore the courſe: divers heretofore have miſtaken *Benzoin* for *Aſa dulcis*, and I doubt the errour is not yet quite extinguiſhed, and *Matthiolus* confeſſeth his former errour therein, which upon better conſideration he amended, *Benzoin* being the gumme of a tree, and being not ſo hot as *Laſer*, which by *Galen* his appointment had for its ſubſtitute *Euphorbium* being growne old. The *Aſa dulcis* being in former

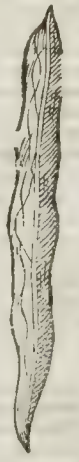
times well knowne and used, is now adayes quite lost and forgotten, being not brought into these parts, but the *Assafeida* hath a continuall residence and recourse unto us, and is as *Garcias* saith, the true and onely *Laser*, or *Laserpitium* of the ancients, and so accepted generally by the *Arabians* in India, and say they erre mightily that make them differing. It is generally used in our dayes for the rising of the mother in women, as all strong and evill sented things be, which depresse it, and is singular good to be put into hollow aking teeth, to ease and take away the paines: One saith he tasted of it for a tryall in a cold time of the yeare, and after a little walking he found himselfe possessed with a gentle sweate, both head, armes, and body, and shortly after found his stomacke better disposed to his dinner then at other times before, and digesting it better. *Garcias* saith the Indians use it to take away the loathing of the stomacke to meate, and to strengthen the weakenesse of it also, and is much used by them to provoke unto Venery, and causeth one to expell winde mightily, which thing was tryed by a *Portugall* as *Garcias* relateth it upon an Horse, whom the King of *Bisnager* would have bought, but that he was over subject to breake winde, but after that the *Portugall* had cured him thereof the King bought him, and asking how he cured him, he answered him with *Assafetida* given in his provender, no mervaile said the King, if he were cured with the gods meate, yea rather with the devils said the *Portugall*, but softly, and in his owne language for feare of being overheard.

CHAP. IX.

Balsamum Peruvianum, The West Indian *Balsamums*.

OF the true *Balsamum* I have entreated in the last foregoing Classis or Tribe, but there have beene divers other sorts of liquours called *Balsamum* for their excellent vertues, brought out of the West Indies, every one of which for a time, after their first bringing were of great account with all men, and bought at great prices, but as greater store was brought, so did the prices diminish, and the use decay, when as it was the same thing and of the same vertue it formerly was: such is the inconstant course of the world in all things. One sort of *Balsamum* which is of most frequent use with us, is called blacke or browne Balsamum, because the colour is blackish, and tending to browne being dropped forth, which as *Monardus* saith is gathered from a tree, somewhat bigger then a Pomegarnet tree, (whose fruite or long pod I here shew you, as I received it, with a very browne almost blacke colour, and smelt so like this *Balsamum* or *Benzoin*, that I am certainely perswaded it was gathered from this tree) not by incision, as the juyces, liquours, and gummes of other trees (which yet this tree doth also in small quantity, yet being white, and so precious with the Indians, that they will not part with any of it) but made after the manner that the Indians use to draw forth the juyces and liquours out of all their other trees, which is by cutting the branches, and the bodies also sometimes of trees into small peeces, which after the boyling in a great quantity of water, the oyle swimming on the toppe, after it is cold is scummed of by them and reserved. This is of a thicke, yet running consistence, and of a sharpe and somewhat bitter taste, but of an excellent fine sent, comming neerest unto *Benzoin*, but will not long endure, being rubbed on any thing that is kept in the ayre, but never loseth it sent being kept close in a glasse or the like. This is used inwardly and outwardly for divers good ules, and although in some it causeth a kinde of loathing to the stomacke, if it touch the tongue, in drinking foure or five droppes in wine fasting, yet it helpeth the weakenesse of the stomacke, the Tissicke, and shortnesse of breath, those that are pursie and the paines and difficulty in making water, it moveth also womens courses, and causeth a good colour, and a sweete breath, rectifieth the evill disposition of the liver, openeth obstructions, and preserveth youthfullnesse even in aged persons that have much used it, and helpeth the barrennesse in women: being outwardly used, it is singular good to heale any fresh or greene wound, and old ulcers, and sores also: it easeth paines in the head or necke, and swelling in any part of the body, the places thereof being annoynted therewith, or a cloth wet therein and applyed: it helpeth digestion, strengtheneth the stomacke, dissolveth winde, easeth the spleene, and the Sciatica, the strangury and stone, and discusseth all nodes and hardnesse of tumours, being applyed warme to the places pained: it warmeth and comforteth the sinewes, and keepeth them from shrinking.

Fructus sive theca Balsami Occidentalis arboris. The fruite of the West Indie Balsame tree.



Balsamum album. Another white and very cleere Balsame of a very sweet sent *Monardus* saith, was brought likewise from the continent of *America* in some good quantity, which was taken by incision from very great trees full of branches to the bottome, whose outer barke is thicke like Corke, under which there is a thinner, from whence being slit the *Balsamum* droppeth forth, the fruite hereof is very small even no bigger then a Pease, and of a bitter taste, inclosed in the end of a long thinne white cod, wherewith the Indians doe smoake their heads against the paines thereof, and rheumaticke destillations: This liquour or *Balsamum* is accounted of much more vertue then the former, one droppe being said to be of more force and effect then a great deale of the other. There is another sort of precious *Balsamum* saith *Monardus* brought from *Tolu*, which is a Province betweene *Carthagena* and *Nombre de Dios*, and is gathered by incision from small low trees, like unto low Pines full of branches, but with the leaves of the *Carob* tree abiding greene alwayes, the manured yeelding more liquour then the wild, and is of great account with the Indians and *Spaniards*, being taught by them: it is of a gold red colour, of a middle consistence and very clammy or glutinous, of a sweete and pleasant taste, not provoking vomit, as other sorts of *Balsamum* will doe, and of an excellent sent like unto a Lemmon, whereof a droppe being let fall into the hand

Balsamum de Tolu.

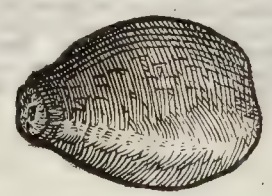
hand, will smell egregiously through all the place. Vnto this *Monardus* attributeth all the vertues of the true *Arabian* Balsame, and much more then unto any of the former, which because I would not make a double repetition of things, I referre you unto them.

CHAP. X.

Bdellium. The Gumme called *Bdellium.*

ALthough *Dioscorides* hath given no description of the tree that beareth *Bdellium*, nor any part thereof; yet *Pliny* in his twelfth Booke and ninth Chapter setteth it downe, that it is blacke or of a sad forme, and of the bignesse of the white Ollive tree, having leaves like an Oke, and fruite like the wild Fig tree, which how truely expressed resteth doubtfull, for *Lobel* setteth forth a sticke of a thorny tree, found among drugges, with divers peeces of gumme cleaving to it, most likely to be *Bdellium* or Myrrhe, which are very like one unto another, being both gathered from cruell thorny trees, and *Thevet* saith, that he saw in one wood of trees, two thousand of these sorts growing mixed together, and that in such countries that are subject to snow, yet the best Authours say that *Arabia* is the chiefe place where they grow, which I thinke never saw or felt snow, yet in *Genesis* 2. *verse* 12. we read that *Bdellium*, and the Onix stone, beside Gold, grew in the Land of *Havilah*, which is interpreted to be Eastward from *Persia*: so that both the tree and the gum thereof are called by one name, for the choyse whereof *Dioscorides* setteth downe that it should be cleere like glew, fat on the inside, easily melting or dissolving, pure or cleane from drosse, sweete in the burning like unto *Vnguis odoratus*, (for so I construe it although divers Authours doe diversly interpret those words, some making *Vnguis* to be a note of white peeces in the gumme, like the naile of ones hand, but in my judgement the *Vnguis* is referred by *Dioscorides* to the sweete fumes of *Bdellium* in the burning, whereunto it is like, for having said that it was *suffitu odoratum*, he would rather shew what sent it had, namely of *unguis odoratus*) and bitter in taste, which are such notes as we can hardly find in any that is brought to us, for we find little bitternesse in any, and lesse sweetnesse in the burning of it or *Vnguis odoratus*, but strong and unpleasant rather, neither is it soft or easie to be dissolved, but hard and not to be dissolved equally, but into graines or knots without warmth, yet is ours of a sad browne colour somewhat like glew, and much like unto Myrrhe, so that they are often mistaken one for another, but that *Bdellium* is harder, dryer, and browner: but there are sundry sorts thereof as *Matthiolus* sheweth, and *Bauhinus* in his note upon him, that he hath seene, for not onely in former times there was much adulterating of drogues by the Indians as it was supposed, but most probable by the *Arabians* who were the chiefe Merchants for those places, and for those things, and I thinke the Iewes learned that art of them, and have exceeded them in cunning. The properties hereof are heating and mollifieth hard tumours, and the nodes of the necke, throate, or sinewes, or of other parts, any way applyed; it proveketh urine and womens courses, and breaketh the stone: it is good for the cough, and for those that are bitten or stung by Serpents: it helpeth to discusse the windinesse of the spleene, and the paines of the sides: it is good also for those that are burst en and have a rupture: it mollifieth the hardnesse of the mother, and dryeth up the moistnesse thereof, and draweth forth the dead birth.

Edelij fructus quibusdam acceptus quem potius cucti Theophrasti fructum optimatur.



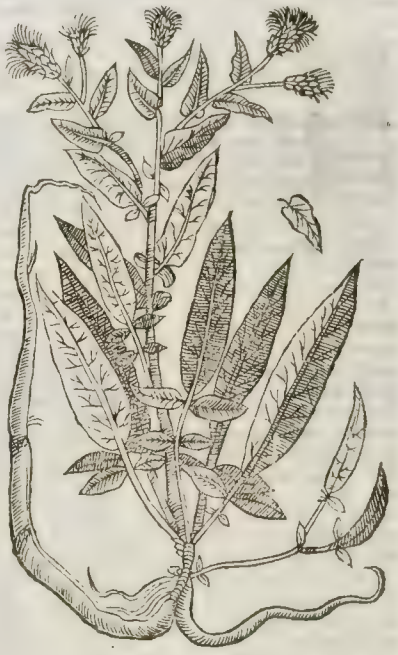
CHAP. XI.

Behen album & rubrum. White and red Ben.

THe ancient Authours have beene both very briefe in declaring these two sorts of Drogues, and are also not at one among themselves what the true *Ben album & rubrum* should be, for *Actuarius* and *Myrepsus* make the *Hermodactilli* to be Ben, how then can any of our Moderne Writers, find out the true Ben of the Ancients, yet divers have appropriated sundry herbes unto them, but they have all come farre short thereof, not onely in the thing, but especially in the properties, *Clusius* setteth forth a kinde of wild *Campion*, which as he saith, the learned Professours at *Salamanca* in *Spaine* tooke to be the *Ben album* of the ancients, but is nothing so: *Dodonæus* setteth downe the *Papaver spumæum* which he calleth *Polemonium* to be it, and some take the wild Parsnep to be it: for the *Benrubrum*, they of *Mompelier* call a small sort of wild Campion, others the red *Valerian* of *Dodonæus*, *Matthiolus* the *Limonium*, and others take the *Bistort* roote for it; *Garcias* saith that some tooke the *Zedoaria* for one of them; *Anguilara* and *Camerarius* also suppose that the garden red Car-

rer, and the white wild kind of it, which the *Italians* call *Carotta bianco* are the red and the white Ben, which they and I alſo ſuppoſe may paſſe reaſonable well as ſubſtitutes for them, untill the true may be knowne. But thoſe things that goe under their names in the Druggiſts, and Apothecaries ſhops, are not knowne, what they are, but are certainely falſe, and not the things they ſhould be. *Rauwolfius* ſaith that he found the true white Ben growing at the foote of mount *Libanus*, in a moiſt ſhadowy place, which the Inhabitants call *Behmen Abiad*, as they call the red *Behmen ackmar*: the deſcription of the white ſort he ſetteth downe thus: the leaves are great long and thicke, like unto the ſharpe pointed Docke, upon long footeſtalkes, but having at the bottome of each leafe, foure other ſmall ones ſtanding by couples each againſt other, thoſe that grow on the ſtalke are leſſe, and without any footeſtalke, the toppe of the ſtalke is parted into ſome branches, each bearing at the toppes a knap or yellowiſh ſcaly head, out of which breaketh a yellow flower: the roote is long and full of joynts, but without any or very few fibres, very like unto Licoris both for forme and greatneſſe, but white inwardly. They are ſay *Serapio*, *Meſues*, and other *Arabians*, hot and moiſt in the firſt or ſecond degree, they comfort the heart, and are ſtirrers to Venery.

Behmen abiad. White Ben.



CHAP. XII.

Benzoin. Benjamin.

THe treē from whence this ſweet gumme *Benzoin* is taken, is very greāt, faire, and high, largely ſpreād and ſet full of branches, in a comely order, the leaves whereof are ſomewhat like unto thoſe of the Citron tree, but leſſer and not ſo greene, but grayiſh on the underſide: from the body hereof which is great and thicke, and the wood very hard and firme, by wounding it as they doe other trees, is drawne forth the gumme, which is of divers ſorts, for ſome is very red, and full of barkes and ſtickes which ſome take to be the ſweeteſt, others is more pure or cleane, nothing ſo red, having many great and ſmall white peeces of gumme in it, which is called the Allmonds of the gumme, another ſort is blackiſh, which is ſaid to come from the younger trees, and called as *Garcias* ſaith *Bunini de Boninas*, and is ſweeter then the laſt. Some ſaith he, call *Benzoin Benjaoi quaſi filius Iavæ*, (which *Scaliger* correcteth, ſaying *Garcias* was miſtaken in thinking that *Ben* in the *Arabian* tongue, ſignifyeth *filius*, when as he ſaith it is *lachryma*, and ſo *Benjaoi*, is *lachryma Iavenſis*) and ſome, as *Ruellius Ben Iudæum*, deceived either by the neerenеſſe of the name, or becauſe he thought that *Iudæa* was the naturall place thereof, and that it was a kinde of *Aſa dulcis*, but without any truth or ground of reaſon, which opinion is yet held with divers who will ſtill uſe it inwardly in place of *Laſor*: it is uſually called in ſhoppes *Benjuinum*, and of ſome *Belzoinum*, and *Benzoin*, or *Benzoinum*: and of the Indians *Cominham*: There hath been ſundry errours among learned men, about this gumme, for finding it to be ſo ſweete, and of ſo delicate a ſubſtance and ſhew, they ſtraight imagined that it could not be but of ſome ſingular vertue, and not unknowne to the Auncients: ſome therefore thought it to be *Cancamum* of *Dioſcorides*, but yet as *Garcias* ſheweth, it chiefly groweth in *Sumatra*, and *Sian*, and *Martaban* neere thereunto, of the *Arabians Louan jaoy quaſi thus ex Iavæ*, and *Vdo* at *Surrat*, &c. and not in *Arabia*, as *Dioſcorides* ſaith *Cancamum* doth: ſome tooke it to be the beſt *Myrrha* called *Myrrha Aminea*, and ſome as I ſaid before to be *Aſa dulcis*, but *Benzoin*, beſides that it was not knowne to the Ancients, it is not uſed inwardly in Phyſicke, neither by the Indians, nor by us that miſtake it not, but is wholly ſpent in perfumes either watēr or oyle, pouther, Pomanders, burning perfumes or the like, and is of an excellent ſent, where or howſoever it is uſed. *Bauhinus* ſeemeth to referre that ſlender long fruite of *Cluſius*, *Exot. lib. 4. c. 11.* unto *Alpinus* his *Felfel tavil*, and that it was naturall of *Florida*, but *Veſlingius* ſheweth it to be farre otherwiſe, as ſhall be ſhewed in the Chapter of Pepper, but I rather thinke it is the fruite of this *Benjamin* tree, or of the browne *American* Balſame before ſet downe.

CHA:

CHAP. XIII.

Bitumen Iudaicum. Dry Pitch of *India.*

THe *Bitumen* or dry Pitch, which the dead Sea in *Iudea* casteth up at a certaine time of the yeare is set downe by *Dioscorides* to be of a shining purple colour, but that which is blacke, is adulterate, and *Matthiolus* saith that the *Asphaltum*, or *Bitumen* of the shops in *Italy* (and sowith us is a mixture, and not the true thing: *Dioscorides* saith it is had from *Phœnicia* (whereof *Iudea* is but a part) from *Babylon*, the Island *Zacynthus* and *Sydon*: but that of *Babylon* which hath beene seene by many in these dayes, is held to be another thing, even the same that the builders of *Babel* used instead of morter to cement their bricks; but that of the dead Sea is only in use and the best, which dead Sea or Lake is of a great extent, yet diversly proportioned by Writers thereof, for *Pliny* as I find *Matthiolus* quoteth him, maketh it to be an hundred miles long, and in the broadest place five and twenty miles over, but Sir *Walter Raleigh* in his Chronicle, relateth *Pliny* to make it lesse then our Moderne Travailers doe, who judge it to be eighteene *Dutch* miles in length, that is 72. of ours, and two *Dutch* miles and a halfe in breadth, that is tenne of ours, accounting one *Dutch* mile to be foure *English*, *Iosephus* saith it is 180. Furlongs in length, that is two and twenty and a halfe of our miles, and 150. Furlongs in breadth, that is eighteene miles and somewhat more of ours, such variety there is in Writers: This Lake or dead Sea is (called by *Galen Lacus Asphaltites*) the same place where *Sodome* and *Gomorrha* with the other Cities stood, mentioned in *Genesis*, being then the pleasantest and most fruitefull valley of all those parts, exceeding *Hiericho*, and the parts thereabouts, which is about fifteene miles from it, and whose River runneth into it, and so drowned therein, yet no fish entereth into it; but now the tract of ground about it for a great compasse beareth a sad face, and is either utterly barren and fruitelesse, or beareth such fruite as is onely faire without and dust within, and the aire noysome and pestilent, by the thicke infectious vapours arising from it, and is neither moved by the wind, nor will suffer any thing to sinke therein, but will swimme on the toppe, and is not onely of a salt but bitter taste, which will corrupt any thing rather then preserve it, as salt Sea water will. There are other sorts of *Bitumen* in the World, as Historians report, as in *Cuba*, and sundry Fountaines neere the sea shore, casting it forth as blacke as Pitch, Another sort is in a Province of *Peru*, where the place is voyd of tree or plant, and giveth a fat liquid *Bitumen* in this manner: Turfes of the earth, being laid on hurdles, the liquour dropping from them, by being set in the Sunne, is kept to heate and comfort any place affected with cold humours and tumours, cureth wounds, and is used for those griefes whereunto *Caranba*, and *Tacamahaca* serve: it is of a strong smell, and of a blackish red colour. The Inhabitants about this Lake, gather this *Bitumen* or Pitch, being an oyle or liquid substance on the water, and hardned by the aire, and spend it chiefly in pitching their Ships, but medicinally it discussеth tumours, and swellings, and mollefyeth the hardnesse of them, and keepeth them from inflammations, and is of singular good use for the rising of the mother, and for the falling sickenesse, to be burnt and the fumes thereof which are strong smelled unto: it bringeth downe womens courses taken in Wine, with a little *Castoreum*, it helpeth the biting of Serpents, the paines of the sides and the hippes, and dissolveth congealed blood in the stomacke and body.

Petroleum quasi petræ oleum or oyle of *Peter*, is a thinne reddish liquour, thinner than oyle of Ollives, and almost as thin as water, and is accounted to be a liquid *Bitumen*, and thought to be the *Naphtha* of *Dioscorides* by *Matthiolus*, because it is so apt and easie to take fire, even by the ayre thereof, and is gotten in sundry places of *Italy*, distilling of it selfe out of a Mine in the Earth, and in *Hungary* also, in a certaine place, where issuing forth in a well together with the water, the owner of the place thought to have the chinkes stopped up with morter, which could not be done without light, the workeman therefore taking a close lanthorne with a light in it, went about it, and being gone downe into the well to stoppe it, very suddainely, the *Peter oyle* taking fire, flew round about the sides of the Well, and with a hideous noyse and smoke, like the cracke of a peece of great Ordinance shot of, it not onely cast forth the Workeman dead, but blew up the cover of the Well into the aire, and set on fire also some bottles of the oyle that stood by the Well, and many persons that stood thereby were scorched with the flame. This oyle of *Peter* is a speciall ingredient to make wilde fire, and is of a very hot and piersing sent and quality, and therefore is used for cold aches crampes and goutes, and to heale any greene wound or cut, suddainely, a little thereof being put into the oyle of Saint *Johns* wort and used.

CHAP. XIV.

Blatta Byzantia sive Unguis odoratus. The sweete Indian sea fish shels.

THis Indian shell, of some sea fish, hath beene the subject of some controversie among the learned: for *Fuchsius* would make the *Onyche* of *Dioscorides*, and the *Blatta Byzantia* or *Unguis odoratus*, to be differing things, and then againe, he would make the *Blatta Byzantia* to be a bone in the mouth, or fore part of the nose of the shell fish *Purpura*, or purple Periwinkle, and this he doth twise expresse in his Annotations on *Nicholaus Myrepsus*, in the composition of *Aurea Alexandrina*, and in *Diamargariton*, into both which compositions the *Blatta Byzantia* are to be put, but *Matthiolus* contesteth against this his opinion, and saith that these sweete shells called *Concbula Indica* or *Unguis odoratus* are taken by *Serapio* and *Avicen*, and the latter Greeke writers, to be no other thing then the *Blatta Byzantia*. And againe that never any Writer accounted that bone in the nose of the fish *Purpura*, to be sweete or numbered among other sweete things, but that the ashes of their shells being burned was drying, and served to clense the teeth, and to restraine the excressences in the flesh, to clense ulcers, and to bring them to skinning: but on the contrary side, the *Arabians* have alwayes used the *Blatta Byzantiæ*, because they were of an astringent

quality, of thin parts & did participate of a kind of ſweetnes, and is good in the diſeaſes and weakenes of the ſtomacke, the ill diſpoſition of the Liver, the fainting of the heart, and the riſing of the mother in women, and as *Dioſcorides* ſaith is good alſo for the falling ſickneſſe, to burne them under their noſes, that the fumes may eaſe their fits, and that none of theſe qualities were ever attributed to the purple Periwinckle ſhell. *Dioſcorides* writeth that the beſt come from the red ſea, and are white and fat, that is, will eaſily burne (but ſuch did I never ſee) and that thoſe that come from *Babylon* are blacke, but the fumes of both are like unto *Caſtoreum*, which argues thoſe not to be right that are in our ſhops, although ſome doe differ from others in the ſite, as is expreſſed in the table. Yet *Matthiolus* ſetteth forth in his Commentaries on *Dioſcorides*, a certaine ſmall long hollow ſhell, almoſt like a tooth, which I rather take to be the *Dentali* of the ancients for *Ungvis odoratus*, being likely ſuch as were uſed in his time, which I have here expreſſed, in the ſame table with thoſe ſorts that our Drugiſts impoſe on us, being of two ſorts, of broad and ſomwhat hollow brown ſhels, the one ſmooth, and the other rugged, and the one ſmaller then the other.

Blatta Byzantia ſive unguis odoratus.
The ſweete Indian Sea fiſh ſhell.

CHAP. XV.

Bolus Armenius. Bolarmoniacke.

THe ſeverall ſorts of Bole or Bolarmoniacke that are to be ſeene at ſundry times with us, doe teſtifie that we ſcarce know which to accept for the right, for *Galen* ſaith it is of a pale colour, and *Pliny* making three ſorts, red, and leſſe red, and a middle ſort, ſheweth that both red and pale were ſo called, and uſed alike, and moſt of the ſorts that we have, have the notes and markes of the true, that is, it is a firme or cloſe earth, heavy without gravell or ſtone, and for the moſt part wholly of one colour, without diſcoloured parts; which doth ſhew that not onely that *Bolus Armenius* which ſome call *Orientalis*, but many other of the finer ſorts, found in other places, not onely as a mine of it ſelfe, but in the mines chiefly of iron, and ſome in thoſe both of gold, ſilver, and copper, may ſafely be uſed for ſome of the ſame purpoſes: but becauſe they all or moſt of them doe colour the hands or fingers of them that touch them, many have ſuppoſed that it may not unfitly be referred to *Galens Rubica Lemnia*, which was differing from the *Terra Lemnia*, becauſe it coloured the touchers hands, which *Terra Lemnia* did not: or may be the *Rubrica Sinopica* of *Dioſcorides*, which was of a liver colour, although peradventure in his time the *Alexipharmicall* qualities were not knowne to him or in his time; as his *Rubrica Fabrilis*, ſo called becauſe Carpenters did uſe to ſtrike their lines therewith, as we doe now with chalke, may be our common Bolarmoniacke, which is courſer, more brittle, and uſed onely outwardly to ſtanch bleedings. All the beſt ſorts of Bole with us, have ſuch a clammy or ſticking quality, which the ancients mention not, that is, if it be touched with the tippe of the tongue, it will cleave very faſt thereto, and the ſtronger it cleaveth, and the harder it commeth from the tongue, the better is the Bole accounted of. And is uſed as a ſpeciall remedy in all contagious diſeaſes of the peſtilence, ſmall poxe or the like, and in peſtilent feavers, and againſt poyſons, and the venome of Serpents: it hath alſo a binding property to reſtraine all fluxes of the belly or of the ſperme, or of womens courſes.

CHAP.

CHAP. XVI.

Borax. Borace.

BOrax or *Borrax* called by the Greekes *Chrysocolla* from the property of sodoring of gold; and *Tincar*, or *Tincal* by the *Arabians*, is said by *Garcias* to be a Minerall matter, gotten out of a Mine of earth, in a mountaine, about an hundred miles off from *Cambayette*, but this is not the *Chrysocolla* of the Auncients, *Dioscorides*, *Galen*, and *Pliny*, which in their times was of a greene colour, found in Mines of sundry mettals, made into pouther and washed often, and prepared for the purpole; but ours is made by many in our owne land as well as in others, by art as Allome is, into small pure white peeces. of no taste or but wallowish; and is easily beaten into pouther; the substance whereof it is made, being brought us out of the East Indies, and no place else that I know, and is certaine white stones, put into, or wrapped in fat or grease, which is called unrefined Borace, and so brought to us, untill it be refined, as we have it to use: the properties whereof besides the sodering of gold, silver, copper, &c. is of good efficacy, not onely inwardly taken to binde fluxes of the belly, as laskes and the like, but the gonorrhea *passio*, or running of the reines, but outwardly to soder up any cut or fresh wound in the flesh, and is often used also with other things as a *fucus* for the face, &c.

CHAP. XVII.

Cambugio quibusdam Catharticum aureum. The golden yellow Indian purger.

THis *Cambugio* as it is of late importation, so it is likewise of small knowledge unto us, whereof it is made, for but onely what we see of it to be a solid peece of substance, made up into wreathes or roules, yellow both within and without, and giving a yellow colour upon the moistening of it, we know not as yet, neither can we learne truely, whether it be a gum or hardned juyce, which it is the more likely to be of the two, because it will so easily dissolve in water, although some suppose it to be the juyce of *Euphorbium*, others of the purging Thorne: some thinke it to be made of Scammony, or Tithymall, others of Spurge, and some of the greater Celandine, other of the middle rinde of the Aldar tree, and lastly *Bauhinus*, because he would say somewhat, maketh a *quid si forte*, what if it be not the juyce of the flowers of *Ricinus* dryed, and I say it is most likely to be the juyce of a peculiar herbe of that Country, that giveth such a yellow juyce as Aloes. It hath gained a number of names, partly from the sundry nations languages, and partly from the mistakings and ignorances of people: as *Ghitta jamaa*, or *Gutta gemou*, or *Gama gitta*, or *Gutta gamandra*, or *Cattaganma*, or *Cambici*, or *Crambici* or *Cambugio*, and some others also, which I willingly omit: it is brought unto us out of the East Indies, and some say from *China*. The properties hereof are to purge both by stoole and by vomit, and is of much use with divers persons of good judgement and quality, who give from three or foure graines unto ten or twelve, or to a scruple or halfe a dramme, according to the age and strength of their bodyes, and worketh gently with some, evacuating forth crude flegmaticke humours from the stomacke, and wheyish from the bowels without any trouble: but contrarily with others it worketh very churlishly, and with much perturbation of the stomacke: Some also use to make small pilles of it, and give it in that forme, especially if the humours be stiffe, and not easie to be avoyded, and for that cause some will adde a little Scammony unto it to helpe the slow working in some bodyes, some also to correct for the tenderer bodies will give it in the pulpe extracted from Currans in white Wine, as a corrector of the quallities, and some in the infusion of Roses.

CHAP. XVIII.

Champhora. Camfire.

CAmfire, called *Caphura* from the *Arabians Cafur*, is such a subtle thing, both in substance and nature, that although it is the gum or liquour of a great vast tree, (like to a Wallnut tree, whose wood is somewhat solid and firme, and of an ashcolour like unto Beech, or somewhat blacker, the leaves are whitish like unto Willow leaves, but neither flower nor fruite have beene observed, yet is likely to beare both) partly distilling forth of it owne accord, but chiefly by incision, which commeth forth cleare and white, and hath no spot therein, but what it acquireth from their foule hands that touch it, yet what we have and use, seemeth plainely to be so made by art, being cast as it were or sublimed into broad round pannes or dishes, and little above the thickenesse of ones thumbe, cleere, white, and transparent, but not to be made into powther of it selfe, (although it is somewhat brittle, and will breake into many small peeces) without the helpe of a blanched Allmond, or some other such like unctuous thing, which hereby will reduce it into fine pouther: neither will it be easily dissolved in cold water, but by warmth will be resolved like unto fat, being easily set on fire, and will burne in the water, serving for wild fire with the other things, and is of a very strong fierce sent, both sent and substance vanishing away, if it be exposed for a while to the open aire; yet the wood being made into severall workes, will smell thereof a long time: Some take it to be hot, because it is of such tenuity of parts. *Rhasis* saith it is cold and moist, but *Avicena* saith it is cold and dry, and that it causeth watchings and wakefullnesse, and quieteth the senses of those that are hot, which are contrary one to the other, as *Garcias*, and *Scaliger* upon *Garcias* noteth it. Camfire doth coole the heate of the liver and backe, and all hot inflammations and distempers of heate in any place of the body, easing the paines in the head, and restraining fluxes, either of blood out of the head and nostrills, being applyed to the forehead with the juyce of Houseleeke or with Plantaine water, and some Nettle seed, or the fluxe of sperme in man or woman, using it to the reines or privy parts, and extinguisheth Venery, or the lust of the body: It is a preserver from putrefaction, and therefore is put into divers compositions and antidotes

dotes to reſiſt venome, poyſons, and infection of the plague or other diſeaſes: it is good in wounds and ulcers to reſtraine the heate, and is of much uſe with women that deſire to preſerve their beauty, by adding a luſter to the skinne.

Chap. XIX.

Caranha. The Gumme *Caranha.*

Aranha, Carauna, or *Caragna,* is a gumme brought from the Weſt Indies, whoſe tree is not deſcribed by any that have written of it, but is a ſoft kind of Gum, wrapped up in leaves that one peece ſhould not ſticke unto another, for it is very cleaving, and is of a darke or muddy greeniſh colour, having ſomewhat a ſharpe pierſing ſent: but there is another ſort as *Monardus* ſaith, that is as cleere as Chriſtall, which I never ſaw: It is a moſt eſpeciall and ſpeedy helpe, when *Tacamahaca* could not as *Monardus* ſaith be had, for all cold aches, and paines in the nerves and joynts, and the ſwellings and paines therin, the defluxions alſo of humours on them, or on the eyes, or on any other part to be laid on the temples or behind the eares: it is alſo uſed as well as *Tacamahaca* for the toothach to be laid on the temples like Maſticke.

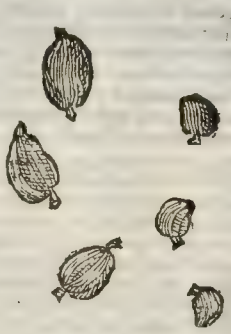
Chap. XX.

Cardamomum. Cardamomes.

There hath beene formerly much controverſie concerning Cardamomes, whether we have either that of the *Grecians*, or thoſe of the *Arabians*, ſome ſuppoſing we have neither, and that the Cardamomes we daily uſe, agree with neither of all their deſcriptions. *Theophraſtus*, *Dioſcorides* and *Galen*, among the auncient Greekes, and *Pliny* among the Latines mentioning but one ſort, and the *Arabians* two,

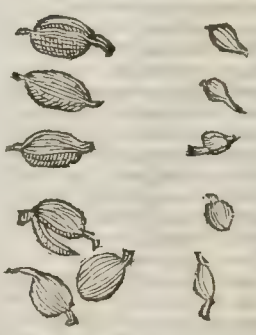
Meliguette ſive Cardamomum maximum et Grana Paradiſi.
Ginny graines.

Cardamomum minus & vulgare,
The ordinary leſſer ſorts of Cardamomes.



Cardamomum majus vulgare.
The greater ſort of Cardamomes.

Cardamomum medium & minimum.
The two ſmalleſt ſorts of Cardamomes.



a greater

a greater and a leſſer, but *Fuchſius* and *Ruellius* thought the *Capſicum* or *Siliquaſtrum*, our red Indian Pepper in long horned huskes, was the *Arabians Cardamomum minus*, which *Matthiolus* diſproveth as improbable, yea impoſſible, the difference both in forme and property ſo farre diſabling it, and ſome ſuppoſing the *Melegueta* or *grana Paradiſi*, which we call uſually graines, or Ginney graines, to be the *Grecians Cardamomum*, and the Monkes that commented upon *Meſues*, tooke the ſaid *Melegueta* to be the leſſer Cardamomes of *Serapio*, all which and many other opinions may now be buryed, and we better reſolved that *Dioſcorides* his *Cardamomum*, not onely agreeth with *Galens*, whereof divers made a doubt, becauſe *Dioſcorides* maketh his to be ſharpe in taſte, and fierce in ſent, pierſing the ſenſes, and *Galen* pleaſant, and not ſo ſharpe or hot as Creſſes: for *Galen* no doubt underſtood the ſame of *Dioſcorides*, when in a receipt that he had from *Pamphilus*, *7. de comp. med. ſecund. locos. c.* 3. he appointeth *Cardamomum delibratum*; Cardamomes that were huſked to be taken, as alſo in *ſecundo antidot.*, *Zeno* caſteth away the huskes, and in the *Theriaca* of *Damocrates* in verſe, Cardamomes in huskes are named, and *Dioſcorides* mentioneth not any huskes, or other forme thereof, becauſe it was ſo familiarly knowne in his time, but that it was not eaſie to be broken, which the huske being tough doe declare: but it alſo agreeth with thoſe we uſe in our ſhoppes, and with that which *Pliny* mentioneth, who as I ſaid in the Chapter of *Amomum*, ſaith *Cardamomum* is like thereunto, that is to *Amomum*, both in name and growth, but that the ſeed is longer meaning the huske with the ſeed in it, as it is uſed to be taken by him and others in many things. And that of *Dioſcorides* agreeing with that we uſe in our ſhops, cannot be any other alſo then that of the *Arabians*, uſually brought to all theſe Chriſtian parts, from the Eaſt Indies as *Garcias* confeſſeth, and eſpecially the leſſer, which as *Garcias* ſaith is the better, although as he ſaith, they be both of one kinde, differing in bigneſſe, the bigger ſort being ſomewhat longer and rounder, and the ſmall ſhorter and not ſo great, but as it were three ſquare. Now as concerning *Garcias* his opinion that the *Arabians Sacolaa quibir*, and *ceguer Cardamomum majus & minus* was not knowne to the ancient Grecians or Latines, aſſuredly he was miſtaken therein, for the notes and markes of *Dioſcorides* his *Cardamomum* doe in all things agree both with ours in uſe, brought from India, and that of *Pliny* as I ſaid before, ſo that now ſeeing both Greekes, *Arabians*, and Latines are thus reconciled together, there needeth not reſt any further doubt hereof to uſe our Cardamomes in any of their receipts: but the *Melegueta* or *Grana Paridiſi*, which is in forme like to a Figge, and full of reddiſh ſeed, although it be good and ſafe ſpice to be uſed, yet can it not be the *Cardamomum majus*, as divers have formerly taken it, and to this day is ſo ſuppoſed by many, but as *Garcias* ſaith, it may be the *Combaſbogue* of *Avicen*, the greater and leſſer Cardamomes differ not in kind but in greatneſſe, the one from the other, and is called as *Garcias* ſaith by the Merchants of *Malavar Etrimelli*, by them of *Zeilan Eaſal*, in both which places it groweth plentifully, as *Garcias* ſaith, in *Bengala* and *Surrat Hil*, and of ſome *Elachi*, but generally of the common people *Dore*, in all thoſe places: The Vertues whereof are theſe: it is hot and dry in the third degree: it breaketh the ſtone, provoketh urine when it is ſtopped or paſſeth with paine: it reſiſteth poyſon and the ſting of the Scorpion, or other venemous creatures, and killeth the birth if they be perfumed therewith: it is good againſt the falling ſickneſſe, the cough, the broad wormes, and the torments or griping paines in the guts, or bowels, and expelleth winde powerfully, both from the ſtomacke and entralls, eaſeth thoſe that by falls or beatings are bruiſed and broken, thoſe that have looſe and weake ſinewes, and the paine of the Sciatica or hip gout, and uſed with vinegar it is good againſt ſcabbes: it is uſed in many of our compoſitions, cordialls, Antidotes and others: the Indians as *Garcias* ſaith, put this to the compoſition of their *Betre* leaves, which they continually chew in their mouthes.

CHAP. XXI.

Caryophylli. Cloves.

ALthough Cloves and Nutmegs, and ſome other ſpices and drogues were not knowne to *Dioſcorides*, *Galen*, and the other auncient Greekes, for *Serapio* in citing *Galens* authority for Cloves, is either falſe or miſtaken, for *Paulus Ægineta* a later Greeke writer doth not mention it, neither yet doe the Latines, or *Pliny* in his time (for his *Caryophyllon*, or *Garyophyllon lib.* 12. *c.* 7. is a round graine like Pepper, as is ſhewed before with the *Amomum*, but greater and more brittle, and was taken by ſome in theſe dayes to be *Amomum*, and by others *Carpobalſamum*) yet were they knowne to the later Greekes by meanes of the *Arabian* Authours, who have brought a more ample and exact knowledge of the Indian commodities, and of many other things, then were formerly knowne, ſo that now what by the *Portugals* travels, the *Dutch* and ours by ſea unto thoſe parts; the tree hath beene well obſerved, to be great and tall, covered with an aſh-coloured barke, the younger branches being more white, having leaves growing by couples one againſt another, ſomewhat long and narrow like unto the Bay tree that beareth narrow leaves, with a middle rib, and ſundry veines running there through, each of them ſtanding on a long footeſtalke, the ends of the branches are divided into many ſmall browne ſprigs, whereon grow the flowers on the toppes of the Cloves themſelves, which are white at the firſt, with their ſprigges, greene afterward, and laſtly reddiſh before they be beaten off from the tree, and being dryed before they be put up grow blackiſh as we ſee them, having foure ſmall toppes at the heads of them, and a ſmall round head, in the middle of them, the flower it ſelfe ſtanding betweene thoſe, conſiſteth of foure ſmall leaves like unto a Cherry bloſſome, but of an excellent blew colour, as it is confidently reported with three white veines in every leafe, and divers purpliſh threds in the middle of a more dainty fine ſent then the Clove it ſelfe, which is a ſmall ſlender fruite, almoſt like a ſmall nayle, and therefore called *Clavus* by many, and from thence the *Dutch* call them *Naegelen*, being of a hot quicke and ſharpe taſte, which are firſt ripe and gathered, but thoſe that doe abide longer on the trees, doe grow ſomewhat thicker and greater, and are not of halfe the others goodneſſe, being called by moſt *Fuſſes*, yet ſome call the ſtalkes of the Cloves *Fuſtes*, and grow of their owne falling, and are not grafted: Hereout likewiſe commeth a certaine darke red gum, and are found uſually put together; Theſe grow chiefly in the *Malucca* Iſlands, where they gather them twiſe every yeare, that is, in *Iune* and *December*, the leafe, barke and wood, being nothing ſo hot in taſte as the Clove: they grow alſo in *Amboyna*, where they grow well, and beare plentifully, being there planted

Caryophyllorum effigies spuria,
A falſe figure of the Clove tree.

Caryophyllorum tormelis genuina effigie.
A branch of the Clove tree with the fruite truely expreſſed.

planted by the *Dutch*, in other places of the Indies more ſcarſely and leſſe fruitefull then there, which are called generally by the Indians *Calefur*, and by thoſe of the *Malucca's*, and in ſome other places *Chanque*. The properties of Cloves are many and excellent, being hot and dry in the third degree, yet ſome ſay the ſecond, and of much uſe both in meate and medicine, comforting the head and the heart, and ſtrengthening the liver, the ſtomacke, and all the inward parts that want heate, helping digeſtion, to breake winde, and to provoke urine: The oyle chymically drawne is much uſed for the tooth-ache, and to ſtop hollow aking teeth, as alſo to be put into perfumes for gloves, leather and the like, the Cloves themſelves for their excellent ſent, ſerving as a ſpeciall part in all ſweet powthers, ſweet waters, perfuming pots, &c. *Garcias* ſaith that the *Portugall* women diſtill the Cloves while they are freſh, which make a moſt ſweet and delicate water, no leſſe uſefull for ſent, then profitable for all the paſſions of the heart, the weakeneſſe of the ſtomacke, &c. and with the pouther of Cloves applyed to the forehead helpe the head ach comming of cold, as alſo by eating them procure a ſweet breath: Some as he ſaith procure ſweating to thoſe that have the *French* diſeaſe, by giving Cloves, Nutmegs, Mace, long and blacke Pepper, but this hath no uſe with us. *Chriſtophorus a Coſta* ſaith that they binde the belly, and ſharpen the eye ſight, cleanſing them and taking away filmes, or clouds that darken it, if their water be dropped into them, and that foure drammes of the pouther of Cloves taken in milke, will procure and ſtirre up venery or bodily luſt.

CHAP. XXII.

China radix officinarum. The roote China.

THe rootē called China, is like to the roote of a great reed, ſome flattiſh, others round, not ſmooth, but bunched or knotty, reddiſh for the moſt part on the outſide, and whitiſh, or ſometimes a little reddiſh on the inſide, the beſt is ſolid or firme, and ſomewhat weighty, freſh and not worme eaten, and without any taſte, but as it were drying: it groweth up with many prickely branches, of a reaſonable great bigneſſe, like unto *Sarſa parilla*, or the prickely Bindeweed, winding it ſelfe about trees, and hath divers leaves growing on them like unto broad Plantaine leaves, the rootes grow ſometimes many together, and may be eaten while they are freſh, and ſo the Indians doe with their meate, as we doe Carrets or Turneps: it not onely groweth in *China*, but in *Malabar*, *Cochin*, *Cranganor*, *Tanor*, and other places there, and is called *Lampatan* by the *Chineſes*, and *Chophchina* by the *Arabians* and *Perſians*. The properties whereof are many, and of great uſe with us in divers caſes: it was at the firſt knowledge thereof to the Chriſtians, and others that dwelt in India, chiefly uſed for dyet drinkes in *Lua Venerea*, the *French* diſeaſe, but ſince it is found profitable in agues, whether *quotidian* or *intermittant*, or peſtilentiall, and alſo hectickes and conſumptions,

China radix officinarum. The true China roote. *Pseudochina.* Baſtard China.

ſumptions, to rectifie thē evill diſpoſition of thē livēr, thē inveterātē paines in the hēad and ſtomacke, and ſtrēngthneth it, and to dry up the defluxions of rheumes, to helpe the jaundiſe and the burſtings in children or others by drying up the humour, which is the cauſe thereof: it helpeth alſo the palſie, and all the other diſeaſes of the joynts and bladder, the gout and Sciatica, and the nodes alſo, and ulcers of the yard, and is good in all cold and melancholicke griefes, ſome take it to be a great incendiary to luſt: the manner of taking it is divers, for ſome boyle it being ſliced thinne, and ſteēped for a good while in water onely, and ſome adde wine thereto, and ſome boyle it in the broth with a chicken, tyed up in a linnen cloath, and to take from a quarter to halfe an ounce or more at a time, as the quantity of drinke or broth you will provide, or as the party can beare. We have had a kinde of roote brought us from the Weſt Indies in forme ſomewhat like unto this true, but harder, redder, and more knotty, which ſome calléd baſtard China, and was not uſed by any that I know, *Monardus* ſaith that the true was planted in the Weſt Indies, and brought from thence very freſh into *Spaine*. *Pſeudochina.*

CHAP. XXIII.

Cinamomum, Canella & Caſſia. Cinamon and Caſſia.

I Know that divers learned mēn are of opinion that Cinamon, Canell, and Caſſia are three diſtinct things, differing each from other, and that we have no true Cinamon brought to us (which controverſie is too long to inſert in this place) but that which we uſually have, is as they call it Canell or Caſſia, and not Cinamon, yet *Garcias* ſheweth that the *Chineſſe* and *Arabian* Merchants, and others were the cauſe of this plurality of names given to one thing, and of the fables that are extant in *Herodotus* and others of it, and other things; and that the diverſity of goodneſſe, either thickneſſe or blackneſſe, or other outward forme, or quicke and ſharpe taſte, or dull and leſſe ſapid, or the place of growing made the ſeverall ſorts that paſſe under ſeverall names, both now and heretofore with the ancient writers; for if one would be curious now to ſearch among the great ſtore of Cinamon, that commeth from the Eaſt Indies yearely unto us, as *Cluſius* and others have done, he might finde as much diverſitie both in goodneſſe and colour as he or any other did at one time or another: for being the barke of a tree, the goodneſſe followeth uſually, either the place of growth, one being better then another, or the oldneſſe of the trees, the younger being the thinner and ſtill having the quicker taſte and the freſher colour, all the *Arabians* as *Garcias* ſaith doe generally call it, be it of what ſort ſoever, *Querfaa*, or *Querfe* (or *Kerpha*, which in *Avicen* is a worſe ſort, as *Scaliger* noteth, in *Zeilan Cuards*, by the *Perſians Darſini*, that is, the wood of *Sina*, which the *Portugalls* firſt corruptly called China, and from thence is the name China uſed by all others: but whereas *Garcias* ſaith that the name of *Cinamomum* was given by thoſe of *Ormus* that bought it of the *Chineſes*, as though it were *China Amomum*. *Scaliger* in his

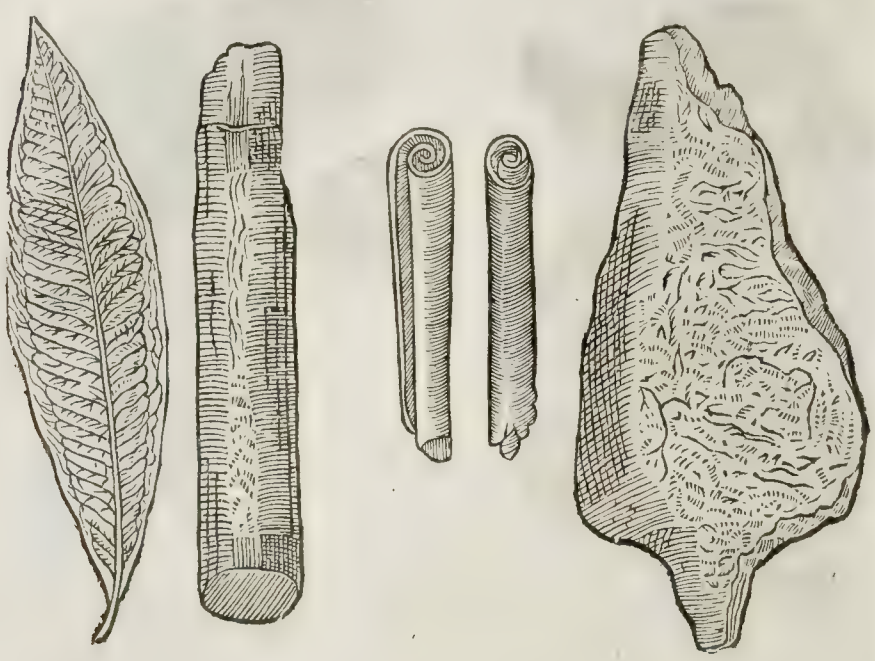
Lobel his Caſſia lignea.



his notēs on him ſaith nothing could be morē unfitly or fooliſhly ſpoken, for China as is ſhēwēd, is but the corrupt pronuntiation of the *Portugalls*, and what affinity ſaith he hath *Amomum* wih *Caſſia*, *Cinamomum* being ſo ancient a word, that we finde it in ſundry places in the Bible, by the Hebrewes named *Kinnamon*, as *Exod.* 30. 23. *Cantic.* 4. 14. and *Prov.* 7. 17. But herein I thinke *Scaliger* is too quicke and ſelfe conceited, for *Garcias* ſayings notwithſtanding may hold good, the *Sinenſes* or *Chineſes*, having beene anciently the greateſt Merchants for thoſe parts as *Garcias* ſheweth. And although it were rare in *Europe*, at a thouſand *denarios* (or *drachmas*, for I thinke them all one) for a pound as *Pliny* ſaith, and chiefely kept by Princes as part of their treaſury, yet we read in the Scripture that the *Iſhmaelites*, *Midianites* and others, were the Merchants of ſpicery for thoſe parts, whereof Cinamon in thoſe three places aforenamed was one no doubt. But *Galen* his deſcription of the Cinamon tree (which was wholly brought in a cheſt to *Rome*, of foure cubits and a halfe in length, having ſome ſixe or ſeven ſtemmes, more or leſſe, riſing from a roote with ſundry branches thereon, whoſe youngeſt and tendereſt, as he ſaith, were the quickeſt and chiefeſt to be uſed, the longeſt of them being not above halfe a foote long, of a colour ſaith he, as if unto milke ſome blacke colour, and a little blew were mixed together) ſo differing as it may ſeeme from that we now ſo call, that it hath cauſed many to ſay, that the true Cinamon is utterly loſt, even as *Opobalſamum* and *Amomum* was thought to be, and peradventure all alike, for if it be granted that wee have Caſſia, as many doe, then aſſuredly true Cinamon will not be farre to ſeeke, for *Galen* in the place before cited, in the end of the ſaid narration of Cinamon hath theſe words, *Univerſa autem Cinamomi natura, ſimilis eſt quodammodo optimæ Caſſiæ*, that is Cinamon is in ſome ſort like unto Caſſia: And therefore all that *Aldinus* hath ſaid, ſeeming to himſelfe to have ſaid ſomething materiall, is little or nothing to any purpoſe. *Monardus* alſo in the place before cited, mentioneth a Weſt Indian Cinamon which is onely a blackiſh purple flat kind of fruite, like a peece of ſilver, the *Spaniards* call a ryall of eight, or a *Dutch* Dollar, but higher in the middle and of that thickeneſſe on the edges, and rough on the outſide and taſting like Cinamon, the pouther being uſed in meates and brothes, the tree being of a meane ſize, with leaves like Bayes, and evergreene, the leaves taſting a little like the fruit, but no part of the tree elſe having any taſte. The Cinamon tree is deſcribed by *Garcias* to be as great as the Ollive tree or ſomewhat leſſe, with many ſtraight branches without knots, covered with a double barke like the Corke, whoſe inner rinde is the Cinamon, and is ſo barked every third yeare, and being cut into long peeces, as if it were the bark of the whole tree, is caſt on the ground, where in drying it is rouled together, as we ſee it, & is better or worſe, blacker or better coloured, as is ſaid before, or by the greater or leſſer heat of the Sun, ſomewhat more changed: the leaves are of a freſh greene colour, and like unto thoſe of the Citron tree (and not like the Flowerdeluce leafe, as ſome have fabulouſly written) or as *Chriſtophorus a Coſta* ſaith with three ribs, but *Garcias* diſavoweth it: the flowers are white, and the fruite blacke and round like Haſell Nuts or ſmall Ollives, and not like Acornes, but the beſt groweth in *Zeilan* with leaves like Willowes rather then Bayes, with ſpreading branches and fruite like Bay berryes, whereof they make an oyle. Now concerning Caſſia, whether it differ in *genere* or *ſpetie*,

Cinamomum Americanum.

ſpetie from Cinamon, called Canell in ſome countryes reſteth to be ſhewed: both *Garcius*, and *Monardus* ſpeaking of the Weſt Indian commodites in the 25. Chapter of his Booke, ſay that the tree is but one that beareth both theſe ſorts, and that the variety of places maketh the difference onely: but becauſe *Dioſcorides* and the other auncient Authours have not onely made them as it were two kindes, but appointed them both to be put into one medicine, eſpecially *Mithridatum*, and *Theriaca Andromachi*, and in the holy annoynting oyle in *Exodus*, we will a little more exactly ſcan the matter, for although we finde that all the Caſſia or *Caſia lignea*, that commeth to us or was formerly knowne is the barke of a tree, and either rouled together like Cinamon, or not rouled but in ſmall or great ſmooth peeces, and therefore may well be perceived to be a ſort of Cinamon, yet the taſte being glutinous leſſe ſharpe and quicke, and more ſtipticke then Cinamon, argueth it to be the barke of another ſort of tree, although of the ſame kinde, and peradventure may be that kinde whereof I entreated in the 64. Chapter of the laſt Claſſis of trees, which I there call *Laurus Americana*. And although that which we have alwayes uſed come to us from the Eaſt Indies, yet that letteth not but that it may grow alſo in the Weſt. And however both *Virgill* and *Pliny* call that herbe Caſſia, which was ſowne or planted in Gardens, as well for Garlands as to feed Bees with their flowers, as hath beene ſhewed before, yet they both doe mention a tree Caſſia. *Virgilli ſecundo Georgicorum* underſtandeth this tree Caſſia, as it is likely in theſe words, *Nec Caſia liquidi corrumpitur uſus Olivi*. And *Pliny lib. 12. c. 19.* in theſe words, Caſſia that groweth where Cinamon doth, is a ſhrub of three cubits high, but on the hills whoſe thicke branches have their barke more like unto leather, which muſt be emptied or hollowed in a contrary manner, unto that of Cinamon, for being cut into ſtickes of two cubits long, they are ſowed into freſh beaſts skinnes, that the wormes may eate out the wood, and leave the barke whole, by reaſon of the ſharpeneſſe and bitterneſſe: the three ſorts of colour therein ſheweth their goodneſſe, that which is white for a foote high next to the ground is the worſt; the next thereunto for halfe a foote is reddiſh, which is next in goodneſſe, from thence upward which is blackiſh, and the beſt, and is to be choſen freſh, of a milde ſent and of a very ſharpe taſte rather then biting, of a purpliſh colour, light in weight, and with a ſhort pipe, not eaſily broken: Thus farre *Pliny*, which for the moſt part he borroweth out of *Theophraſtus*, *lib. 9. c. 5.* where he ſaith Caſſia is a ſhrub, like the *Salix Amerina*, which becauſe it is hard to be barked, men have invented the way by beaſts skinnes, as is before ſaid out of *Pliny*: The barke being onely to be uſed, which I rather thinke to be a fable of report then truth: the reſt that followeth in *Pliny*, is out of *Theophraſtus* in his narration of Cinamon, where *Theophraſtus* maketh five ſorts, the loweſt the worſt, becauſe it had leaſt barke, and the uppermoſt the thickeſt as the beſt (which how likely it is that the barke of any ſhrub or tree, ſhould be thinneſt below, and thickeſt above, when as the contrary is alwayes ſeene in all ſorts of trees, with us and others too I thinke) *Galen* in acknowledging Cinamon to be a tree with ſundry branches, ſaith he hath obſerved not onely the branches of Cinamon to be converted, and very like thoſe of Caſſia, but thoſe of Caſſia alſo to be in all parts like Cinamon, and that which bore the name of *Zigi*, was ſo like to Cinamon, that divers told it for Cinamon, when it was but true Caſſia. And againe ſaith that the *Junior Andromachus* mentioneth a kind of thicke groſſe Caſſia, which he called *Caſſa fiſtula*, becauſe it was rouled together like a Pipe. And therefore *Serapio*, *Avicen.* and *Meſues*, in their compoſitions appointing *Caſſia fiſtula* to be uſed, which as *Matthiolus* doubteth whether it were their owne or their tranſcribers fault, this Caſſia is not to be taken, but that which hath hard canes, and a blacke pulpe, more fitly termed *Caſſia ſolutiva* or *nigra*, and which many yet doe uſe in ſtead hereof; but as *Leovicenus* ſaith, their errour is too great to be excuſed, that appoint the ſhels of that *Caſſia ſolutiva*, to be uſed to move womens courſes, to helpe their hard travels in childbirth, and to expell the ſecondine or afterbirth. By all which that is now ſaid, you may ſee plainely that Caſſia differeth not much from Cinamon, and yet that is differing from it, *Lobel* giveth us the figure of another ſort of Caſſia, which was as thick as ones thumb rugged & in taſte like unto the thick courſer ſort of Cinamon. Having thus ſhewed you the whole deſcription of theſe things, and the various paſſages of them, let me alſo give you the Vertues which are theſe. Cinamon is hot and dry in the ſecond degree, of very ſubtle parts, and very aromaticall, it is very cordiall, comforting the heart and ſtrengthening a weake ſtomacke, eaſing the paines of the winde chollicke, eſpecially the diſtilled water of it, the ſtopping of the urine and womens abounding courſes, it cauſeth a good colour in the face, and a good ſweete breath, and reſiſteth the poyſon of venemous creatures, it is much uſed alſo in laskes to binde the body, the deſtilled water is moſt effectuall in all theſe griefes, but the chymicall oyle thereof is much more hot and pierſing.

Xylocaſſia Lobelij

I thinke it not amiſſe in this place to make mention of ſome other barkes of trees and rootes, that have beene brought both out of the Eaſt and Weſt Indies: The firſt whereof called white Cinamon, being in long roules, white both within and without, turned together like unto Cinamon, is thicke and more tough then Cinamon, the taſte is ſomewhat hot, and reſemble Cloves rather then Cinamon both in taſte and ſent, being very aromaticall, yet leſſe in each quality, then Cloves, ſo that one would thinke he had ſmelt and taſted weake Cloves.

Canella alba.

Another ſort rouled like Cinamon, not very thicke, which the *Dutch* as *Cluſius* ſaid *lib. Exot. 4. c. 2.* brought out of India, comming from the *Moluccas* and *Iava*, and which he doubteth whether it be not the Caſſia of the ancients, or ſome of the ſorts whereof *Dioſcorides* maketh mention: ſome of it was whitiſh on the outſide, and ſome more browne, like the worſer ſort of Cinamon, of no unpleaſant taſte, yet not ſo ſharpe as Cinamon, and having a little clammineſſe in the chewing, the people uſe the pouther in their meates.

An Caſſia veterum Cluſio.

Another *Cluſius* maketh mention of in the ſame Booke and third Chapter, which was a foote long or more, and three inches in circuite at the lower end, and two inches at the top, had the outer barke thinner, then the inner, for it had two, and was very rugged, full of chinkes and with ſome holes, and ſometimes two at a place in a certaine order, all the length thereof but ſet a thwart thereon, which ſeemed to be the places where the leaves grew, both the barkes were of an excellent ſweete and aromaticall ſent and quicke taſte eſpecially the outermoſt.

Canella alba ex arbore.

Monardus ſpeaketh of a Canell of the new world, growing in *Quito*: the trees ſaith he that beareth this Cinamon are of a meane bigneſſe and ever greene (as moſt of the Indian trees are) the leaves are like to thoſe of the Bay tree, the fruite is like unto a little hat, as broad as a Doller, or *Spaniſh* peece of eight, and ſometimes greater, the brimmes being of their thickeneſſe, and both inſide and outſide, of a darke purpliſh colour, ſmooth within and

Canella novi orbis.

rugged without, the toppe being higher, and had a ſtalke whereby it did hang, and was faſtened to the tree, this fruit was in taſte very like unto that of Cinamon, with ſome aſtriction joyned thereto, and the pouther of them ſtrewed on their viands, was uſed for Cinamon, the barke of the tree was thicke, and had no taſte or ſmell of Cinamon, the fruite onely being of uſe, and good to comfort the heart and ſtomacke, diſſolve winde, mend a ſtinking breath, procureth a good colour in the face, and to provoke womens courſes.

CHAP. XXIV.

Coculus Indus. Cocculus Indi.

THeſe berryes or round ſeed the *Italians* call *Cocco di Levante*, and the *French* accordingly, they are of a blackiſh aſhcolour on the outſide, having a white kernell within them of an hot taſte, drawing water into the mouth, and as it ſeemeth grow many together like Ivy berryes, yet each by it ſelfe on a ſtalke, ſome thinking them to grow upon a kinde of Nightſhade, others on a kinde of Tithymall, or Spurge. *Cæſalpinus* calleth them *Galla orientalis*, others *Baccæ orientales*. They are wholly ſpent either to make baites to catch fiſh, with other things for that purpoſe, or the pouther uſed to kill lice and vermine in childrens heads.

Coculus Indus. Coculus Indi.

CHAP. XXV.

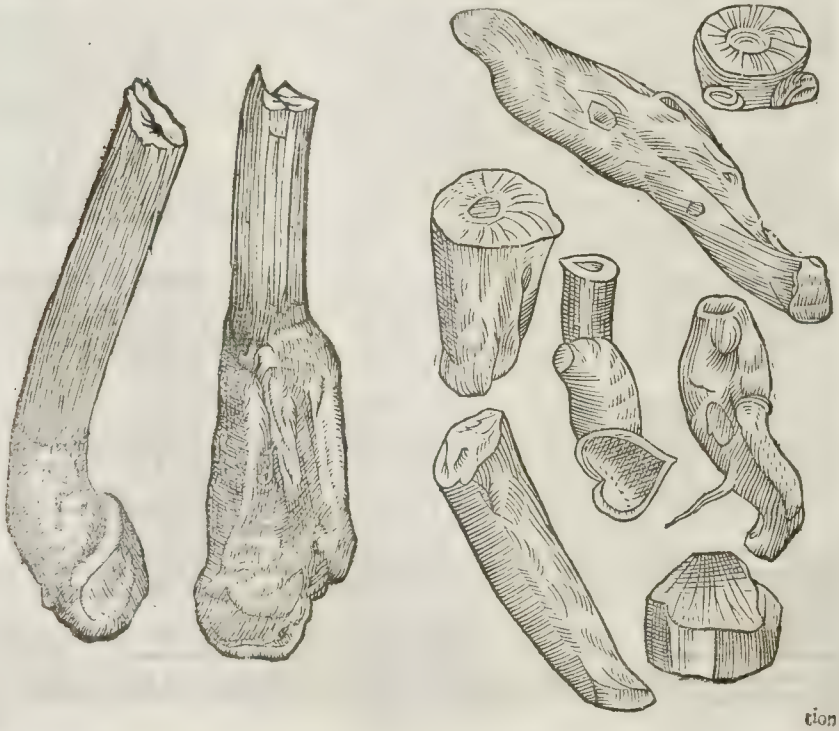
Coſtus. Coſtus.

THeſe hither parts of *Aſia minor*, and *Africa*, beſides all *Europe* as it is ſuppoſed for many ages of theſe later times, have wanted not onely the uſe, but the knowledge of the true *Coſtus*, of any of the three ſorts, that *Dioſcorides* mentioneth, eſpecially *Europe*, and it was the *Arabians* that firſt brought in the deviſion thereof into ſweete and bitter, when as neither *Dioſcorides* nor *Pliny* make any men-

Coſtus Indicus Cl. ſij.

Coſti diverſa ſpecies.

Divers ſorts of Coſtes exhibited for Coſtus.



tion

tion of bitterneſſe, although *Galen* doth, but of ſweeteneſſe in taſte, none of them all but *Actuarius* onely, who is one of the later Greeke Writers: *Garcias* to excuſe the *Arabians*, of this their diviſion of *Coſtus* into *dulcis* and *Amarus* ſaith, that it might be that while the *Coſtus* was freſh it is white, and hath no bitterneſſe in it, but growing old, it groweth blacke and gathereth ſome bitterneſſe to it, by the decaying, but the Apothecaries ſhops, eſpecially in *Europe*, ſhew two ſorts, farre differing the one from the other, both in forme and ſubſtance. Of late dayes indeed they have beene more carefull and induſtrious to know the right, and to ſearch for it and uſe it, the *Portugals* therefore from the Indies brought in one ſort, which as *Garcias* ſaith was onely uſed there and no other, but as *Cluſius* noteth it in his *Scholia* thereon, this being a ferulous ſpongy ſtalke, with the toppe onely of the roote to it, differeth from thoſe of *Dioſcorides* and *Pliny*, the one intimating it to be a roote, by ſaying it was uſed to be adulterated or falſefyed by obtruding the rootes of *Helenium Comagenium* for it, which were neither very hot nor very ſweete in ſent, and *Pliny* ſaying plainely it is a roote: but there hath beene very lately brought unto us a ſort of roote called *Coſtus*, and taken by many to be the *Syriacus*, yet ſome thinke it to be the *Arabicus* of *Dioſcorides*, being ſomewhat yellowiſh on the outſide, and white within, ſmelling and taſting ſomewhat ſweete like Orris, which therefore I judge cannot be right, which as *Pliny* ſaith is very hot in taſte and very ſweete in ſent, and *Galen* giveth it ſuch a degree of heate, beſides the bitterneſſe, that it will exulcerate the skinne: many therefore have ſubſtituted *Zedoaria* in the want thereof, which is the beſt ſubſtitution that can be, agreeing both in forme and degree, moſt of all thereunto; and therefore divers have contended that it was the true *Coſtus*, but in regard *Zedoaria* hath more bitterneſſe and leſſe ſweeteneſſe therein, it cannot be *Coſtus*, yet may be admitted as the ſubſtitute thereof, but *omne ſimile non eſt idem*: Some againe hold Angelica to be the blacke or Indian *Coſtus*, but being a homebred plant ſo, it cannot be, and beſides hath no ſuch bitterneſſe and ſharpeneſſe therein, as *Galen* giveth to *Coſtus*. The *Arabians* call it *Coſt* or *Caſt*, thoſe of *Surrat Uplot*, and in *Malacca* where they much uſe it *Pucho*. The Vertues hereof as *Dioſcorides* hath ſet them downe of the true *Coſtus*, (which as is before ſaid is doubtfull whether we have or no) are theſe. It provoketh urine and womens courſes, and helpeth the diſeaſes of the mother, as well by bathing as fuming: two ounces thereof being drunke, helpeth the biting of Vipers, and is good againſt the paines of the breſt, convulſions, or the windy ſtitches, ſwellings or puffings in the ſtomacke, ſides or body, being taken with wormewood in wine, and being taken with ſweet wine it provoketh Venery, it killeth the broad wormes of the belly: it is uſed with oyle to annoynt the body, before the cold fit of agues to warme it, and thereby to expell it, as alſo againſt the weakeneſſe of the ſinewes, and the hip-goute, and amendeth the diſcolouring or blemiſhes of the skinne and face, uſing it with hony and water, and as *Galen* addeth by reaſon of the light bitterneſſe, and much ſharpeneſſe and heate, it will exulcerate.

CHAP. XXVI.

Cubeba. Cubebs.

CVbebs are ſmall berries ſomewhat ſweete, no bigger then Pepper cornes, but more rugged or creſted not ſo blacke nor ſolid, being either hollow or with a kernell within it, of a hot glowing taſte, not fierce as Pepper, and having each a ſmall ſhort ſtalke at them like a taile, and therein very like to a kind of Pepper, was for a while wont to be brought to us, which the *Portugals* called *Pimenta del rabo*, *Piper caudatum*, Pepper with a taile, and was forbidden by the King of *Portugall* to be brought any more leaſt it ſhould ſpoyle the ſale of the other Pepper: this ſaith *Garcias* groweth on trees leſſe then Apple trees, with leaves thereon narrower then thoſe of Pepper running on trees like Ivy, or rather like Pepper, but not like unto *Ruſcus*, called *Myrtus ſylveſtris*, as *Matthiolus Silvaticus* thought, as *Serapio* ſet it downe but falſely: the flower is ſweete, and the fruite groweth cluſtring together, yet not in bunches as Grapes, but more ſeparate. *Ceſalpinus* tooke them to be *Amomum*, many others out of *Avicen* and other Authours, tooke them to be the *Carpeſium* of *Galen*, and ſome to be the ſeed of *Vitex*, or *Agnus Caſtus*. The *Arabians* call them *Quabebe*, and *Quabebe chini*, but in *Java* where they grow plentifully enough, and are there of ſo great account, that it is ſaid, they boyle them in water before they part with them, fearing they might be ſowne and grow in ſome other place and uſe them much to ſtirre up Venery, and to warme and ſtrengthen the ſtomacke overcome with flegme or winde, and doe purge the breſt of thicke tough humours, helpe the ſpleene, diſſolve wind and are very profitable for the cold griefes of the wombe: being long chewed with Maſticke they draw much flegme and rheume from the head, and ſtrengthen the braine or memory.

Cubeba. Cubebs.

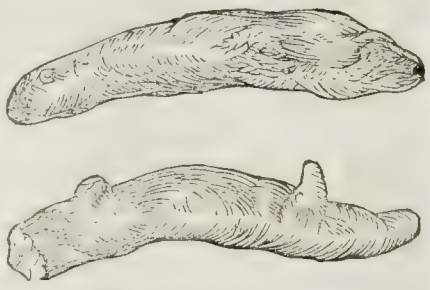
CHAP. XXVII.

Curcama. Turmericke.

IT is very likely that Turmericke is *Dioſcorides* his *Cyperus Indicus*, which he ſaith hath a roote like Ginger, giving a yellow colour like Saffron, being bitter in taſte, and a preſent helpe to take away haire: all which notes agree notably hereunto, the roote being much liker to Ginger then unto any kinde of Cyperus, and therefore we may marveile the more why *Dioſcorides* ſhould referre it to Cyperus, unleſſe he had underſtood of thoſe that had ſeene it, that it did grow like unto a Cyperus, and is very yellow both within and without, bitter in taſte, and may ſerve for the haire, as it is ſpecified, although peradventure the force is halfe loſt by the long carriage, but this is not the *Curcuma* of *Serapio* or *Avicen*, as *Matthiolus*,

thiolus hath well noted, which is no other then the greater *Celandine*, whose roote is yellow, and therefore the Apothecaries in former times tooke it for *Curcuma*, and put it into the composition called *Diacurcuma*. *Garcias* and *Christophorus a Costa* call it *Crocus Indicus*, and say that the Indians call it *Alad*, and *Manjale*, the *Arabians Habet* and *Curcum*, the *Turkes* and *Persians*, *Saroth*, and *Darfard*, that is *lignum luteum*: it beareth larger and thinner leaves then Millet, of a paler greene colour, a stalke full of leaves, compassing one another to the toppe: the roote is slender and yellow, neere unto the forme of Ginger, nothing so bitter, being fresh by reason of the moisture in it, as when it is dry. It is of great use with many for the yellow jaundise, either the pouther or the decoction being taken, for it doth open the obstructions of the gall and other parts, it is of very good use in old and inveterate griefes and sickenesses, and an evill disposition of the body called *Cachexia*, and is very profitable against the dropsie: it is much used to colour divers small workes of wood instead of Saffron, the Indians use it much both to season and colour their meates and brothes, because it is to be had better cheape than Saffron, and as *Garcias* saith is put into those medicines are made for the eyes, and for the itch, if some juyce of Orrenges, and the oyle of the Cocar or Indian nut be mixed with it.

Curcuma. Turmericke.



CHAP. XXVIII.

Folium Indum sive Malabathrum. *Folium Indum* or Indian leafe.

THat *Dioscorides* and the other Auncient writers had divers false relations of drugges and other things brought unto them; which they have set downe in their writings, may be well discerned by this called *Malabathrum*, which they said as they were informed, did grow in ponds and watery places swimming thereon as the *Lens palustris*, Duckes meate doth: for it is well knowne now and so set downe by *Garcias ab Orta*, and other the later writers, that they are the leaves of a great tree growing on land farre from waters in *Cambaia*, as well as in divers other places of the East Indies, and called *Tamalapatra* by them, which by corruption was first changed into the Greekes ταμαλάδαγες and then into *Malabathrum* but by the *Arabians Cadegi Indi*, that is, *Folium Indum*, and are faire broad leaves with three ribbes onely in them, a little pointed at the ends, which have beene brought unto us, although very sparingly, and among them some yet abiding on their branches, two usually at a joynt tasting somewhat hot like unto Bay leaves, the barke of the branches also tasting like unto them; among these leaves likewise have beene found sometimes a small fruite like unto an Ackorne in the cup, which it is most probable is the fruite of the tree, and gathered with the leaves: but hath beene formerly supposed by some to be the fruite of the Cinamon tree, and by others obtruded for *Carpobalsamum*: Some have taken these to be the leaves of the Clove tree, but they are therein much deceived, for they have not those three eminent ribs in them that these have, which is a note to distinguish them from all other leaves almost, but some more probably have taken the leaves of the tree called *Betre* or *Tembul* to be *folium Indum*, because they have also some ribs in them, as *Marcus Oddo* doth in his examination of *Theriaca Andromachi*, but is also deceived, for the *Folium Indum* is not familiarly eaten as the *Tembul* or *Betre* leaves are: but whereas the substitute for these by our later Physitians appointment is the Maces which is the skinny covering of the inner shell of the Nutmegge, I find that *Avicen lib. 2. c. 259.* appointeth *Thalisafar* to be taken, which he describeth in the same Booke and 687. Chapter, and by the most judicious is the *Macer* of the ancient Greeks, which they knew better then *Macis*, which was utterly unknowne to them, but as if they were one and the same thing, it hath beene generally so appointed, and is yet so taken to this day by most, but that *Macer* is not *Macis*: *Pliny* in his time sheweth plainely *lib. 12. c. 8.* saying *Macer* is the reddish barke of the roote of a great tree, called by the said name, comming from India, but there would

Folium Indum sive Malabathrum.
Folium Indum or Indian leafe.

need

need fewer ſubſtitutes by many in our medicines as well *Mithridatum* as others, if our Apothecaries would be moſt carefull and induſtrious to give inſtructions to the Merchants travailing into thoſe parts, and out of thoſe Authours that have written of them to give the *Arabian* or Indian name, whereby they might get the *genuine* druggest: for as *Garcias* ſaith there might eaſily be procured ſo much of this *Folium Indum*, as would ſerve all *Europe* if it were but ſought after, and ſo I may ſay likewiſe for divers other things. The properties are to provoke urine powerfully, and is very beneficiall to the ſtomacke, warming and ſtrengthening it, and maketh a ſweet breath, it reſiſteth the force of venomes and poyſons, and therefore is put into Antidotes and other compoſitions that are cordiall or ſtomachicall: it hath the properties of *Nardus*, but more effectuall being heated in Wine, it helpeth the inflammations and redneſſe in the eyes being bathed therewith.

CHAP. XXIX.

Galanga major & minor. The greater and leſſer *Galanga*.

THere are two ſorts of *Galanga* a greater and a leſſe: the greater is the weaker and duller in operation, and groweth in *Iava* and *Malabar*, to be two cubits high, having leaves foulding about the ſtalke at the lower end, being ſomewhat long and narrow, and pointed at the end ſomewhat like a ſpeares head, of a ſad greene colour on the upperſide, and paler above: the flower is white but without any ſent, the ſeed is ſmall and neglected: the roote is ſomewhat great at the head like the reed (but *Cluſius* taketh it to be more like unto a Flower de luce, then unto an Aſphodill as *Acoſta* compareth it, and that the plant may be a kind of *Iris*) of a blackiſh colour on the outſide and whitiſh within, and uſe it familiarly in their meates as well as in their medicines: The leſſer kind riſeth not above a foote high, having leaves like the Mirtle, the roote is ſmall and bunched, firme and ſomewhat tough, red both within and without, and ſmelleth a little ſweet or aromaticall, it groweth in *China*, where it is called *Lavandou*, the greater being called in *Iava Lancuaz* yet both of them are uſually ſo called: it is more commonly planted by the roote as Ginger is, then of the ſeed, yet is both wayes encreaſed: There is great controverſie among the later writers, concerning *Calamus*, *Acorus*, and *Galanga*, for ſome have held opinion, and is yet continued by many, that the *Galanga major*, is the true *Acorus* of the Ancients, which is an errour eaſily confuted if they that ſo thinke would but compare the notes of *Acorus* given by *Dioſcorides* with this *Galanga*: others deny our *Calamus* in the Apothecaries ſhops, to be the true *Acorus*, which *Matthiolus*, *Cluſius* and others have moſt evidently maintained, and as I have ſhewed before in the end of the firſt Claſſis of this Worke. Some alſo have ſet downe in their writings that *Galanga* is the roote of *Schanauthos*, but I may ſay *enarraſſe eſt confutaſſe*. The leſſer *Galanga* is both of more uſe, and of greater effect, and indeed is to be uſed onely in all the compoſitions wherein *Galanga* is appointed, and is very profitably given to cold and weake ſtomackes, and in the griping paines of the belly by winde, the diſeaſes of the mother, and ſtop-

Galanga major ad vivum ut fertur.
The Plant of Galanga as it groweth.

ping of urine, in which diſeaſe it hath a mervailous ſpeedy operation, to cleanſe the uritories from ſlimy flegme and ſtones gathered in them, or the paſſages in the necke of the yard, as alſo to waſte and conſume away fleſhy excreſcence in the necke of the bladder or yard: it alſo cauſeth a ſweet breath, being ſometimes chewed in the mouth, and helpeth a cold moiſt braine: it helpeth the trembling of the heart, and the wind chollicke.

CHAP. XXX.

Gummi Elemi. Gum *Elemni.*

THis Gum being not mentioned with the former becauſe we have not as yet attained the knowledge of the tree, from whence this Gum *Elemni* is taken; I reſerved for this place: for although ſome have taken it to be the liquour or gum that floweth out of the wild *Ethiopian* Ollive tree, yet it is moſt certaine it cannot be it, for it is ſaid that the gum of the Ollives will not burne like Roſſin, nor melt with the heate of fire, as the Gum *Elemni* will doe, which is a yellowiſh kinde of Gum, cleere and tranſparent, which being broken ſheweth more white and gummy within, quickely taking fire, and both burning and melting thereat, of a little quicke ſent and taſte. It is of eſpeciall uſe in all wounds and traſh of the head and skull, to be mixed with the Balſames and oyntments uſed for that purpoſe: it is alſo often uſed for the tooth ache, when the paines come by the defluxion of rheume into them, to lay a plaiſter thereof on the temples as they doe with Maſticke.

CHAP. XXXI.

Guajacum ſive Lignum Sanctum. Lignum Vite.

THe *Lignum vitæ* that groweth in ſome parts of the Indies, is much better then in others, yet is the wood of all, hard, firme, cloſe and heavy, ſo that it will ſincke in water more then Ebony and not ſwim, of an hot ſharpe and reſinous taſte, ſomewhat burning in the throate: the blacker or browner is better then the yellow, being in a manner all heart, the yellow being as it were but the ſappe: The tree groweth great with a reaſonable thicke greeniſh gummy barke, ſpread with ſundry armes and branches both great and ſmall, and on them winged leaves ſet by cou-

Guajacum ſive Lignum ſanctum. Lignum Vite.

Guajaco Occidico ſimilis arbor. A Weſt Indian tree like Guajacum.

plēs

ples one against another, which are but small thicke, hard, and almost round, with divers veines in them, abiding ever greene on the branches: at the joynts and ends of the branches come forth many flowers, standing in a tuft together, every one on a long footestalke consisting of sixe whitish yellow leaves, not very great with some threds in the middle, which afterwards turne into flat yellowish gristly fruite, of the fashion of the seed vessell of a *Thlaspi* or *Bursa pastoris*, that is, with two divisions, and in the one side a hard gristly seed, as hard as an horne almost, the other being for the most part empty, hanging downe together by their long footestalkes: it yeeldeth forth also a gumme or Rossin, of a darke colour, which will easily burne; it groweth in sundry places of the West Indies, where they call it *Guayacan*, and wee in Latine thereafter *Guajacum*, by some *Lignum Sanctum*, and *Lignum Indicum*, and taken by some to be a kinde of Ebony, for the firmenesse and weightinesse, others a kind of Boxe. But as I have said heretofore in sundry places of this Worke, most of the Trees and Herbes that grow in the Indies are differing from those that grow in *Europe*.

Guajaco Occiduo similis arbor. A West Indian tree like Guajacum.

The branch of this tree I have here exhibited unto you, as *Lobel* hath set it forth before, not having had the like brought since his dayes that I know, which sheweth a more supine negligence in all our Sea men, then heretofore was usuall, which he hath described in this manner. The tree is great from whence this was taken, growing upright, whose barke was like unto that of the *Iudas* tree: the greene leafe, of the forme of a Pomecitron leafe, but thicke and smooth like unto the Bay, but larger and shorter, with sundry veines running therethrough, at the toppes of whose branches grow cods, of a leather like substance, and round forme in a manner flat like a peece of mony, in whose middle is contained flattish seed, like unto a Lentil, both for colour and forme, and bitterish taste.

Palum Sanctum Indiæ Occidue. A differing Indian Guajacum.

Lobel hath remembred this also in his *Adversaria* after this fashion: Divers have thought this to be a Palme like the last, or *Palus Sanctus*, a stake of such a holy tree, which yet is differing from it or *Guajacum*, howsoever it was so signified: for the tree is not very great like unto an Ash, but smaller, and the barke much like it in colour: the leaves were like Plaintaine leaves but thicker, fatter, smaller and shorter: the fruite was of the bignesse of a Wallnut, which served them to purge their bodies.

The diseases for which the usuall *Guajacum* is appointed, that is, both the wood, the barke and gum, are sundry, helping all cold flegmaticke and windy humours, and although they are good, and with effect used for Epilepsies or the falling sicknesse, catarrhes, rheumes and cold destillations on the lungs, or other parts, coughes also and consumptions, the gout and all other joynt aches, and many other the like diseases, and to make the teeth white and firme, if they be often washed with the decoction thereof: yet was it first onely used for the *French* disease, as we and the *Spaniards* call it, the *Neapolitane* as the *French* call it, the *Spanish pippe* as the *Germans* call it, but as it is indeed the Indian contagion: for when *Christophorus Colonus*, commonly called *Columbus*, first opened the West Indies to the *Spaniards*, they companying with the Indian women, got this their familiar and naturall country disease from them, and brought it with them from *Santo Domingo*, being the first place the *Spaniards* possessed there, unto the King of *Spaines* campe, which was then at *Naples*, treating of a peace with the *French* King, in *Anno* 1493, bringing of the Natives with them, both men and women: The Physitions in those times not knowing this disease or the causes thereof were of divers opinions, some taking it to proceed from the corrupt victailes that the souldiers were forced to eate, which bred melancholicke and adust blood, and humours, others to the conjunction of *Saturne* and *Mars*, and thereupon (not knowing it to be a new disease) they called it by divers names, as the Leprosie, the running scabbe, the poxe and the like, referring it to some of the ancient knowne diseases, but all in vaine: the cure hereof by this wood, first was knowne from whence it first sprung: for a *Spaniard* being plagued with this disease, having an Indian that played the Leech, to be his servant, was cured thereof by drinking the decoction of the wood given him by the Indian, which cure was presently divulged, not onely to the rest of the *Spaniards* in the Indies, but in *Spaine* also, and so consequently to the whole world.

CHAP. XXXII.

Hermodactylus. Hermodactiles.

HErmodactiles are to be numbred among the unknowne Drugges, the shame of the Physitions in all ages and countries, who (although they put of the matter to the Apothecaries, and the Apothecaries to the Merchants that bring many sackes full into their Countries with other commodities, but they also take no further care to know what they are, or where or how they grow to declare it) should be skillfull in the knowledge of all Plants, and should give order that the unknowne might be made more manifest: but what doe I in so saying? runne my Barke on the Rockes and put her in danger of splitting. Divers of the later Writers, as well Greekes, as *Arabians* and Latines have made mention of the Hermodactile, (although none of the Ancients) and have set downe the properties, well knowne by experience unto them, but no one hath ever declared either the place or manner of the growing thereof, but onely *Mesues*, who maketh a shew of description, which is almost as good as nothing, saying it is a roote of a mountaine herbe, whereof some are long like a finger, and are round, white both within and without, which every one may see by the sight, but that any should be long like a finger, is but rather his supposition from the name, then that he ever saw such indeed, and therefore divers have imagined diversly, some taking them to be the rootes of *Colchicum*, but they are dangerous if not deadly, besides the unlikenesse in forme, colour and substance: others take the *Dens Caninus* to be they, but they are more unlikely, for they are small and long, not thicke and short, as the Hermodactiles are: besides the quality no way agreeth, therewith *Matthiolus* first tooke the *Orchis Serapias*, called *Palma Christi*, the handed testicle to be they, because the word ἑρμοδακτύλος signifieth *Hermetis* or *Hermi dactylos*, *Hermes* fingers, and these rootes being like the fingers of ones hand, may well be so called, but having

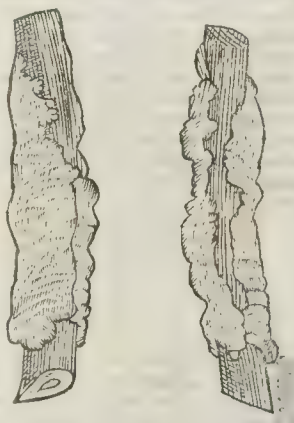
having himselfe refused this errour, he fell into another as bad, taking *Iris tuberosa*, the Velvet Flower de luce to be *Hermodactiles*, for the same cause that the rootes thereof runne out like fingers, which are such silly opinions that he may justly be beaten with his owne rod, that is, be taxed as he doth others, that in referring Plants doe not examine and well perpend each part, rather then any one, before they determine of any thing: for Hermodactiles notwithstanding the Etimology of the word, have no shew or likenesse of fingers, but are small and somewhat flat, thicke and short white rootes, yet some are blackish which are not good, of the fashion almost of an heart, as it is painted on the Cardes, of substance firme, yet soft and easie to be cut or made into pouther, and of little or no taste, but drying, Master *Finch* our *London* Merchant was herein deceived, by taking the kernells of the *Tribulus aquaticus* Water Caltroppe, for Hermodactiles as I thinke, as I have shewed you in that Chapter: Yet I would we might be better informed of the truth herein, that if any can finde that bigger fruite, growing in any of the ponds or waters in our Land or elsewhere, by breaking the wooddy shells of them, and comparing the kernells with our Hermodactiles in shops, that so thereby we be fully assured of the truth hereof. It is most effectuall in purging flegmaticke, slimy, and watery humours from the joynts, and therefore conduceth to helpe the gout and other running joynt aches, it is also of much use with other things for dyet drinkes, that are made of *Guajacum*, *Sarsa* and the like, and to very good purpose.

CHAP. XXXIII.

Lacca. Gum Lake.

Lacca is no gumme distilling out of trees as other gummes doe, although it will melt with heat and burne with fire as they will, but is a certaine peculiar matter, elaborate and wrought by certaine great winged Ants that breed in the ground, and sucking out from great trees of divers sorts but especially from that which is called *Mala Indica*, hereafter set downe, from which they take the substance of what they work, about the smaller branches (as Bees doe their hony and hony combes) and make this *Lacca*, which is a darke red substance, somewhat transparent, somewhat like, but harder then any Gumme, which being chewed will make the spittle looke red, and is first wrought on stickes by the Natives of the Countries (the Ants I meane) then melted being cleered from the stickes, and the winges of the Ants, and made into cakes or thin peeces, which are so brought tous as well as on the stickes, and is the originall of the hard waxe, wherewith Letters are sealed by the helpe of a candle, whose colloures of red, greene, yellow or blacke, are added in the new melting of it againe, and making into such roules as we buy it to spend, but some to adulterate it, and make it cheaper, put usually waxe into it, which maketh it softer and runne quicker: it is called as *Garcias* saith by the Indians in *Pegu*, and *Martaban*, where the best is made, *Tree*, but elsewhere generally by the *Arabians*, *Persians*, and Indians *Loc*, and *Loc Sumutri*, as though it were made in *Sumatra*, but that saith he is not so, for it is but imported thither, and exported againe into other Countries. Great controversies are extant about this *Lacca*, whether it should be the *Cancamum* of *Dioscorides* or no, for the name of *Lacca* was neither knowne to him, nor any of the *Grecians* or Latines, nor yet to *Paulus Ægineta*, a later Greeke writer, or in the age wherein he lived, as *Scaliger* setteth it downe in his notes upon *Garcias*, although *Avicen* and *Serapio* seeme to cite *Paulus* to be of that opinion: but *Garcias* saith that neither *Avicen* nor *Serapio* knew *Lacca*, because they make it to be like Myrrhe, and that it is sweete (as *Dioscorides* saith *Cancamum* is) and therefore used as a persume, both which properties are wanting in *Lacca*, and further saith *Avicen*, that it hath some properties of *Carabe Amber*, although unlike it in substance, and yet *Carabe* is knowne to be drying and binding, and *Lacca* is an opener of obstructions: And againe he saith that *Lacca* falleth from the aire, upon Service trees, when as neither any Service nor Medler trees grow in India as *Garcias* saith, and that it is the gumme of a tree growing in *Arabia*, and that it is brought from *Armenia*, which things if they be true concerning *Cancamum*, they are not so for *Lacca*, for so they say it is the *Cancamum* of *Dioscorides*, and from their opinions have the succeeding ages beene led to hold the same errour for the most part: for the Monkes that commented upon *Mesues*, substituted *Sanguis draconis* for *Cancamum*, whom *Matthiolus* confuteth sufficiently: Some againe tooke *Benzoin* to be *Caucamum*, which is as erronious as any: *Amatus Lusitanus*, and *Garcias* doe both agree, that the true *Cancamum* is the Gum *Anime*, called by some *Animum*, especially that sort that is whitish and cleere, like unto white Amber, for there are three sorts brought from *Ginny*, and those parts by the *Portugals*: The second sort is blackish, somewhat like unto *Colophony*, which *Amatus* taketh to be the *Myrrha Aminea* of *Dioscorides*. The third sort is yellowish and dry like Rossin, but all smell sweet being burned, and are good against cold griefes. The Lacke or Laake, which is a colour for Painters, is made of Brassill or other dying stuffes, & hath in former times been put very ignorantly by some Apothecaries into the composition called *Dialacca*, but that error is well reformed since the true *Lacca* was brought and made knowne to them. *Lacca* is hot in the second degree, it strengthereth both the stomacke and liver, and freeth them from obstructions, and dissolveth the hardnesse of the Liver, helpeth the yellow jaundise and driveth forth

Lacca. Gum Lacke.



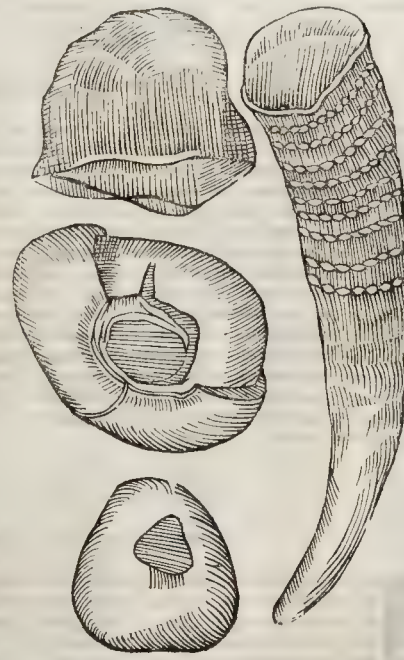
forth the watery humours of the dropſie, provoketh urine and helpeth to breake the ſtone both in the kidneyes and bladder. Turners may herewith ſet a firme and dainty red colour into their Workes, by holding it thereto in the turning,

CHAP. XXXIV.

Lapis Bezar. The Bezar ſtone.

THe Bezar ſtone that is now frequent with us, but not that minerall Bezar ſtone of *Serapio*, and the other *Arabian*, whoſe knowledge is now quite loſt, is of ſo high eſteeme, even next unto Vnicornes horne, and of ſo much and excellent uſe in Phyſicke that I could not leave it out from the number of thoſe eſpeciall drugges we have for uſe in our ſhoppes. There are two ſorts thereof to be had, the one brought from the Eaſt, the other from the Weſt Indies, and knowne by the ſeverall names of their Countries: the Eaſt Indie Bezar is the beſt, both in eſtimation and uſe, and commeth to us in ſundry formes, and of ſundry ſizes, for ſome are great, and thoſe are for Princes and great perſons, becauſe they are not onely more rare to be found, but thought to be of the more efficacy, and therefore as Diamonds, Pearles, &c. the price of them riſeth according to their greatneſſe, *Garcias* ſaith he had one weighing almoſt five drammes, as if it were rare to have one of that bigneſſe, but I have ſeene ſome that have weighed above foure ounces, and ſome much more (but I am in doubt that they were counterfeit, and made ſo great by art, that they might be of the more eſteeme, for I accounte the ſmall ones or thoſe of a meane ſize to be the trueſt and beſt, if any be) ſome are round, others long or ſomewhat flat, yet all of them for the moſt part of one colour, that is of a darke aſh-colour, or greene darke Ollive colour, and ſmooth ſhining, (as if they were made out of one maſſe of ſtuffe and polliſhed) with ſundry coates, ſcales or fouldes like Onions, ſome more, ſome leſſe, according to the greatneſſe of the ſtone, and the ſcales thicker or thinner alſo thereafter, having in ſome a ſtraw or peece of haire wrapped cloſe together, or a little pouther in the middle whereabouts the ſtone is formed, and is accounted the beſt and trueſt, others have ſmall ſtones of fruites, or other things in the middle of them, which are not thought ſo good, but rather counterfeited, being of a firme ſubſtance being broken, I meane the ſcales: the beſt is gritty, and eaſie to be bruiſed into pouther, and as ſome ſay diſſolving in water, if it lye long therein (which I am in doubt is a ſigne of impoſture) and is inſipide without any taſte at all. The Weſt Indie Bezar is likewiſe of divers formes, ſizes, and colours, ſome having ſcales thicker or thinner, and ſome none, with either pouther or peece of a roote, or ſome other thing in the middle of the ſtone, but is of nothing that account with us as the Eaſt Indian Bezar is, although ſome thinke they are taken from one kind of beaſt, and as *Ioſma Ferrus* ſaith in his Booke of ſecrets, Printed in the *Italian* tongue, (on whoſe relations concerning theſe beaſts, and the Bezar taken from them, *Baptiſta Corteſius*, hath commented in his eighth *decade Miſcelanearum medicinalium.*) there are ſix ſorts of theſe beaſts, in the Weſt Indies in whom they breed, but that thoſe onely are of moſt vertue that are taken from thoſe beaſts that live on the hils and mountaines, and feed on the more vertuall herbes there growing, and namely *Contrayerva* as the *Spaniards* call it, which maketh the ſtone to be the more effectuall (for as *Ferrus* ſaith, ſome of the roote hath beene found in the middle of the ſtone,) they for the moſt part grow in the Plaines and Champion grounds: the beaſt as *Monardus* deſcribeth it, being but one of the ſixe ſorts, is almoſt as bigge as a ſtagge, and of the like quickneſſe and agility, but bodyed like a Goate, with hornes turned backewards (the figure whereof as *Cluſius* was informed, he hath ſet forth with the forme of an hoofe, as it is in his *Scholia* upon *Garcias*, and I here exhibite their formes unto you with the ſtones) and therefore the Natives call them mountaine Goates (ye ſhall have *Ferrus* his full relation of them all, in another worke hereafter) but more properly peradventure as *Cluſius* ſaith, *Rupi capræ* Rocke Goates. (but *Petrus de Oſma* in his Letter to *Monardus* deſcribing that beaſt or Goate, which onely as he ſaith breedeth in the Mountaines of *Peru*, and in no other Countryes in thoſe Indies beſide; and out of which they gathered their Bezar

Lapis Bezar cum ungula & cornuario malis.
The Bezar ſtone with the hoofe and horne of the beaſt.



Bezar, ſaid that they had no hornes) and are of a reddiſh browne colour for the moſt part, ſo ſwift of foote that they were onely to be caught when they were killed or ſhot with their Muſquets, the ſtones grow as he ſaith there, in a certaine purſe or skinne in the maw of the beaſt, wherein the wholeſome herbes that they eate are received and kept, untill by rumination and chewing them anew, they paſſe them into their bodies, and ſaith moreover, that the ſtones that breede in the beaſts that feed on the mountaines, are of much more vertue then of thoſe that feed on the plaines: thoſe of the Eaſt Indies as *Garcias* ſaith are had from *Malacca*, and divers other places, as well as *Perſia*, but none are like in goodneſſe unto thoſe that are brought from *Perſia*: The Moores he ſaith are ſo excellent in the knowledge of them, that by ſight they can tell of what Country breeding they be, and wherher they be counterfet or no, by cruſhing them in their hand a while, and then breath on them, and if any wind paſſe through them they pronounce them falſe The ſtone is called as *Garcias* ſaith *Pazar* by the *Arabians* and *Perſians* from *Paſan* which ſignifieth a Goate, but we call it corruptly Bezar, and the Indians *Bazar*, (but *Scaliger* correcteth this errour in him, and ſheweth that the *Arabians* unanimouſly call it *Balzahar*, that is *Alexipharmacum*, for they tooke the word from the *Perſian* word *Bedezahar*, becauſe it reſiſteth poyſon, and we thereupon doe call all thoſe things *Bezardica* that are reſiſters of poyſon, as Antidotes and the like. But the ancient *Arabians* had a minerall Bezar of divers colours, which they celebrated to be of as great or greater efficacy then this ſtone, the true knowledge whereof as I thinke is either utterly loſt, or as *Monardus* ſaith of his owne experience of no worth. This Bezar ſtone is not onely uſed againſt poyſons and venomes, but againſt the peſtilence, and contagious diſeaſes, in malignant feavers alſo, and in many other diſeaſes to provoke ſweate, and thereby to expell evill vapours from the heart and vitall ſpirits, and for ſwounings, and againſt melancholly alſo, and the diſeaſes that riſe from thence, and to preſerve ſtrength and youth, by taking it foure or five dayes together, ten graines or leſſe at a time, after the evacuation of the body: the pouther thereof put on the place that is bitten by any venemous creature, doth free them from danger of death, and likewiſe put into a plague ſore that is opened, it doth the like, *Monardus* hath ſet downe many experiments of the Bezar ſtone, upon ſundry and ſeverall perſons infected with ſundry diſeaſes, as who will may read them at length in that treatiſe which he wrote concerning this Bezar, and the herbe *Scorſonera*: but eſpecially againſt poyſon or venome, and citing the teſtimony of *Rabbi Moſes Ægyptus*, ſaith, theſe three are by experience the moſt effectuall in the world therefore, that is the ſeed of the Citron fruite, the *Smaradge* or Emerald ſtone, and this Bezar ſtone. Theſe teſtimonies I thinke are ſufficient to evince that opinion is held by many that there is no vertue, or at leaſt no ſuch vertue in the Bezar ſtone as it is related, which they thinke by ſome tryall that they have made thereof, and not anſwering their expectation doth confirme them the more in that opinion: but if they have orderly proceeded, and heedfully obſerved, not for one but many times, and in many perſons, and have been ſure of right and good ſtones, that they have given, and yet have done no good, I would rather ſay there is ſome defect in the conſtitution of our bodies, by the moiſture, &c. of our climate, then diſable the verity of ſuch reports of famous and worthy men.

Chap. XXXV.

Liquid ambar. Liquid amber.

Liquid Amber is a thicke Roſſinlike Gumme, dropping of it owne accord onely by inciſion from certaine huge great trees in the Weſt Indies that are full of branches, covered with a thicke aſh-coloured barke, having leaves like unto Ivy leaves, which gumme is of a very ſtrong ſweet ſent, ſomewhat like unto *Storax liquida*, and may well be uſed inſtead thereof, but there is another courſer ſort, made by boyling the branches, and ſcumming of the uppermoſt fatneſſe that is gathered there, which is thought to be that *Storax liquida*, that is uſually ſold in the Druggiſts and Apothecaries ſhops: out of the firſt ſort while it is freſh and laid in the Sunne, there droppeth a certaine cleare reddiſh yellow oyle, called the oyle of Liquid Amber, and of ſome that know no other, Liquid Amber it ſelfe: which becauſe it is the purer part is more effectuall and of the milder ſent, ſome uſing it with other ſweetes to perfume gloves withall, but is of ſingular good uſe, either of it ſelfe or mixed with other things, to comfort and warme a cold moiſt braine, uſed like unto an oyntment, and eaſeth all paines and griefes that riſe of a cold cauſe, being applyed thereto: it wonderfully comforteth and ſtrengthneth a weake ſtomacke, helping digeſtion and procuring an appetite, but more effectually if it be mixed with ſome *Storax*, and a little Muske, and Amber, and laid as a plaiſter to the ſtomacke: it likewiſe is profitable in all cold griefes of the mother, warming mollefying and diſſolving all tumours, and opening the obſtructions and the courſes that are ſtopped, it is hot almoſt in the third degree, and moiſt in the firſt.

Chap. XXXVI.

Macer Græcorum. The *Gracians* Macer.

Many taking *Macer* to be *Macis*, and both one thing, have erred egregiouſly for of *Macer*, *Dioſcorides*, *Galen*, and *Pliny*, have written and ſhewed the faculties; but of *Macis*, which is one of the barkes or coverings of the fruite of the Nutmegge tree, they have not made any mention, being a thing utterly unknowne unto them, for if they had knowne it, they muſt needes have heard and knowne of the Nut or Nutmegge, whoſe covering it is; but *Macer* is as they all ſay, a yellowiſh barke, which muſt needes be underſtood of ſome tree, *Galen* ſaith that *Macer* is of a cold and earthly eſſence, and but little hot: but *Macis* is of much heate and no cold. And *Pliny* ſaith plainely that it is the barke of a great roote, and *Avicen* and *Serapio*, both knew the difference, and entreate of them diſtinctly in ſeverall Chapters, calling this *Thaliſofar*. This *Macer* being called *Macre* by the Indians as *Acoſta* ſaith, is a vaſte

and

and large ſpread tree, (the barke onely of whoſe rootes they uſe) greater then any Elme, whoſe leaves are ſixe or ſeven inches long, and two inches broad, of a pale greene colour on the upperſide, and deeper greene on the underſide, bearing a ſmall yellow fruite no bigger then a penny, heart faſhion, taſting like an Allmond or Peach kernell, covered with a double thin tranſparent skin like a bladder, cloſe joyned together, and growing out of the middle of a leafe, which is as bigge as the reſt on the tree, but that it is a little rounder pointed, and narrower towards the ſtalke, being of a colour betweene red and yellow, and crumpled with divers veines therein, and like unto the bladders of the Elmetree leaves: every part of this tree giveth milke as the Mulberry tree doth, and hath very great and faire ſpread rootes like the *Ilex* or Evergreene Oke, covered with a thicke, rugged and hard barke of an aſh colour on the outſide, and white within, full of milke while it is freſh, but turning yellowiſh when it is dryed, very aſtringent and a little ſharpe or biting withall, which vaniſheth quickely: it loveth to grow in moiſt ſandy grounds, and killeth all the herbes that would grow about it, and is found in *Malabar Cochin*, *Cranganor*, and many other places and Iſlands in the Eaſt Indies; the *Portugals* call it *Arbore de las Cameras*, and ſome *Arbore de Sancto Thome*, and *Macruyre*. The barke of the roote is uſed much in all the Hoſpitalls, and of great account with the Indians to cure laskes and fluxes of the belly, or blood, and give it either in pouther mixed with ſome ſowre milke, or ſteeped in whey all night and taken in the morning, and ſometimes if it be needfull as *Acoſta* ſaith, they put ſome *Opium* to it to make the medicine the ſtronger, and the *Arabians* put both *Opium* and Nutmegs to it and ſo cure them: the ſaid barke alſo ſtayeth vomitings or caſtings, and ſtrengthneth the weake ſtomacke.

CHAP. XXXVII.

Manna granata & liquida. Manna in hard graines and liquid or thin.

MAnna is of two ſundry ſorts, the one hard and in peeces, either greater or leſſer, the other liquid or thin like the thinner or at leaſt leſſe thicke hony, yet ſome have thought that the Manna *thuris* was that Manna that was uſed in ſhops, but *Monardus* in one of his Epiſtles confuteth that errour, ſhewing that it is but the ſmall peeces and duſt of the *Thus* or *Olibanum*, that became ſo by the bruiſing and rubbing of one peece againſt another in the carriage. Of the dryer or hard ſort there is ſome diverſity for that which is gathered in *Arabia* differeth from that in *Perſia*, and called *Tranſchibil*, being in ſmall graines ſomewhat like unto Coriander ſeed, and is gathered as *Rauwolfius* ſaith, from thoſe trees the *Arabians* call *Agull* or *Alhagi*. *Arabica.*

Another ſort is reddiſh and gathered from herbes and plants. That of *Perſia* is called *Xircaſt*, that is, *Lac arborum*, the milke of trees and is white like that of *Calabria*, whereof ſome is as ſmall as Hempeſeed, others as big as Allmond Comfits, yet *Garcias* ſaith that the liquid ſort is ſo called by them. Another ſort is gathered in *Armenia*, in great lumpes as *Rauwolfius* ſaith of a browniſh colour. Another ſort is affirmed by *Aphrodiſeus*, cited by *Niger*, that falling as an honie dew on mount *Libanus* in *Syria*, is by the heat of the Sunne congealed into a hard Sugar which the Inhabitants call *Sacchar*, from whence came the Latine word *Saccharum*. All theſe ſorts are recorded by ſundry Authours, ſome contrarying one another as is aforeſaid, and might be much more amplyfied, if this place were fit for it, and therefore as I take it I have taken the truer reports: but whereas ſome have thought that ſome of theſe ſmaller white ſorts might be the Manna of the *Iſraelites* wherewith they were fed, and therefore called bread, and that from heaven, yea Angels food, not that Angels feed thereon, but κατ' ἐξοχὴν, *per excellentium*, the choyſeſt and chiefeſt, for forty yeares together in the wilderneſſe of *Sinai* and *Arabia*, it ſheweth that ſuch have had little converſation with the holy Scriptures, as a learning not fit for them to underſtand, which is flat againſt ſuch conceites divers wayes. Firſt that this of theirs had no purging, but a nutritive quality: ſecondly it was not ſo Sugar ſweete as ours in taſte: thirdly it fell not on certaine dayes, that is on their Sabbaths, although it did all the weeke after: fourthly it fell all the yeare long, and not the Summer onely as our Manna doth: fifthly it vaniſhed away as ſoone as the Sunne grew hot upon it, but ours is condenſate thereby: ſixthly it would putrefie if it were kept but two dayes except the Sabbath: And laſtly as it is in *Joſhua*, the 5. Chapter, and 22. verſe. That Manna ceaſed to fall any more, after they had eaten the corne of the Land, which was the morrow after the Paſſeover, whereby you may ſee how vaine the conceites, and long altercations of men are, about thoſe things whereof they are ignorant, or not ſufficiently inſtructed: this is but *obiter*, and therefore to proceed. In *Europe* we have Manna, and called *Calabrina*, as being thought not to be found in any Country beſides, but both *Matthiolus* and *Bellonius*, and ſome others alſo doe teſtifie there againſt, upon their owne ſight and knowledge, as *Matthiolus* that in *Goritenſi*, and *Tridentino agris*, hee gathered it himſelfe and *Bellonius* in *Brianſon*, and others in other places, but there is a great controverſie and contenſion amongſt many learned men: firſt whether it be onely a dew of heaven condenſate by the cold of the night, or whether it be as a gumme iſſuing from trees, being inciſed or wounded as other trees are that yeeld gummes: The Monckes that commented on *Meſues*, and ſo likewiſe divers others were confident that it iſſued from wounded trees like gumme, and was no dew from heaven, for proofe whereof they alledge that the trees being overſpread or covered with any cloath or the like, there would not be found in the morning that any dew had falne thereon, and yet the trees yeelded the Manna, which *Matthiolus* thinking to diſprove, ſaith it cannot ſound to reaſon or the courſe of nature, but rather that the matter happeneth in this ſort, that the dewes falling on the dry barkes of thoſe trees were drunke up by them, and was forced forth againe in ſmall peeces like gumme in the heate of the yeare, not being the proper juyce of the trees, but what it had gained as aforeſaid, and that this kinde of Manna was more looſe and ſpongy, and leſſe operative then the other, and that this happeneth by the ſecret and hidden property in nature, eſpecially of thoſe trees to containe this dew in them in lumpes, and not to be liquid as on others all about them: A ſecond controverſie is whether Manna be gathered onely from the manured or wilde Aſh or no, ſome affirming it ſtrongly, and others denying it as ſtoutly, as is before ſaid, that *Matthiolus* and *Bellonius* doe declare: A third controverſie is, whether it be onely peculiar to *Calabria*, and *Apulia*, or not, which although ſome affirme for *Calabria*, yet ye heare as before, it is to be found in many other places. The other ſort that is liquid or thin, is gathered both in *Aſia* and *Europe* alike, but that of the *Levant* is both more *Alia rubra. Perſiana.* *Armeniaca.* *Syriaca.*

plentifull

plentifull, and more both usefull and operative, for although in many *European* Countries, and in our Land likewise a kind of honey or sweete dew hath beene found on trees and herbes in the heate of Summer, and in some places so clammy, that the Mowers sithes cold hardly cut the grasse, for the clammines thereon, untill the Sunne had beene some time thereon to consume it and dry it up. The *Arabians* and others call it *Terenjabin* and *Trangibin*, the Greekes as *Galen* saith μέλι & ἀερόμελι, and *Cordus* thereafter *Drosomeli*, *Pliny* calleth it *Mel ex aere*, or as others, *Mel aereum*, *Mel roscidam*, or as *Hipocrates*, *Cedrium mel*, and others *Manna liquida*, or as *Matthiolus*, *Manna purgatoria*: but a little to shew you my minde concerning these sorts of Manna, that as the liquid sort is both for substance and property alike, but that the *European* is not so plentifully to be gathered: So I verily thinke that the diversities in the other dryer, both for forme of greater or smaller peeces, or colour of white browne, or reddish, is rather from the climate and dispositions of the Heaven to be hotter or more temperate: but it seemeth to me very strange if true, that in *Calabria* onely the *Fraxinus* or *Ornus* should sweat out Manna, by lancing their barkes, when as in other countries both of *Europe* and *Asia*, it is gathered from sundry other trees, where no sort of Ashes grow, and that no Author mentioneth any cutting of their barkes, to cause them yeeld Manna. You heare my opinion, whether true or false, I leave to them that can verifie or disprove it, by proofe, and true judgement. The properties of both these sorts of Manna are neere alike in purging, being of a meane temper, yet a little more enclining unto heate, or as *Averrhoes* saith, hot and moist, for by their gentle working they may safely be given to children, and women with child, and put with other purgers they helpe their working and evacuate choller: but because the grained Manna is both more frequent and more of use with us (the other being seldome seene or used) I will rather insist on the properties thereof which is that beside the purging quality, it quencheth thirst and doth lenifie the hoarsenesse of the throate, and allay the sharpenesse of choller, and the nauseous humours in the stomacke: the often use thereof for those that are much given to be costive is very profitable, to be either taken alone or to be put instead of Sugar into brothes, drinkes, or other things.

Chap. XXXVIII.

Moschus. Muske.

MVske is a precious matter, and both is and hath beene of great worth and esteeme, not onely to perfume things with, but for medicine to great good use: The beast is deciphered out by some to be a kind of wild Goate, or Bucke Goate, that is, betweene a Bucke or Deere and a Goate, and therefore some call it *Dorcas Moschi*, others *Gazella Indica*, and some *Capreolus Moschi*; others make it to be like a Foxe, others like a Greyhound, and some a goodly reddish beast *Gudderi*, some againe say it breedeth onely in *Golchanda*, and some say in *Pegu*, a Country in the East Indies, and most store in the Country of the *Tumbascanes*, others say in *China* or *Cathaya*, others againe say none breede in *China*, but is brought thether from other places: It hath a big body, and two tuskes say some, others say two above and two below, in the lower mandible of the jaw, sticking forth like a Bore or Hogge, and without hornes say some. This beast as it is said by some, when it is in the heate of lust hath a certaine swelling rising thereby: to the stomacke, the blood and matter gathering together, raiseth an Impostume or bile, which the beast desirous to be eased of, refusing meate and drinke in the meane time untill it be ripe, doth then rub it selfe against the stones and stumpes of trees, whereby the Impostume breaking the matter congested sticketh on those thinges, which by the heare of the Sunne and temper of the climate is hardned, and all the ill sent (if it have any) consumed thereby, the perfect sweet sent remaining, and this is the best and choysest Muske is to be had, and gotten by great persons, chiefly to serve their use. Others report that every full Moone it hath neere the navell under the belly an empostume, or bladder full of blood, which the hunters after they have taken them, doe cut of and dry them in the sun, which becommeth the best Muskes. But there are other sorts besides those that are more plentifully to be had and sold to the Merchants, gotten and made by art: for having hunted those wilde Goates and killed them, they cut them in peeces, presse out the blood, and dry it, and sometimes putting a little of that purer Muske thereto, they put it up into small purses as it were made of the said beasts skin, and this is the usuall Muske sold by these counterfeiters and false deceivers. Besides the great use of Muske, for all sorts of perfumes, and to weare about one, it is very beneficiall to comfort the heart and fainting spirits, and taketh away the passions and trembling thereof, maketh it merry and joyfull, and helpeth to expell sadnesse, it comforteth warmeth and refresheth the braine and senses, quickening the dullnesse thereof, and is a helpe unto Venery: it is put into many cordiall pouthers in our shops, and into many other compositions for the same purposes as also for delight into many other things. It hath beene observed by some that the dung of a small beast, that is like a Weasell called a Marterne, smelleth somewhat like Muske. The female Crocodile also hath a small bladder or skin about the maw, which smelleth so strongly of Muske, that the waters wherein they breed, and are plentifull of them smelleth so strongly thereof, that few can abide to drinke thereof, and most doe refuse it therefore. There is also a kinde of great water-Rat that smelleth like Muske, &c. But I reserve the relation of the many wonderfull Workes of God in nature, to another Worke.

Chap. XXXIX.

Mumia. Mumme.

THat which is called *Mumia*, of *Pomponius Mela*, *Condita corpora & Medicata funera*, of *Pliny*, *Servata corpora* (being of much and excellent use in all Countries of *Europe*) is the very body of a man or woman; (brought chiefly from *Egypt* or *Syria* adjoyning, and no other part of the world so good) Embalmed after the manner was used in those Countries onely, (and not with Aloes, Myrrhe, &c. as being

being those things the *Iewes* and others used to embalme their dead bodies, nor yet with *Pissalpalthum*, as it is likely other nations did) which was with *Cedria* and *Nitar*, that did so consume the moisture of the carkase, and preserve it from putrefaction, that it was thereby made to endure entire and unconsumed for ever: for the *Egiptians* in former times being wonderfull ingenious, and of a most subtle knowledge in all humane wisedome, (as it is recorded of *Moses* to be learned in all the wisdome of the *Egiptians*, *Acts.* 7. 22.) misliking as it should seeme the custome of the Latines, which was to burne their dead bodies to ashes, and to preserve them in an urne: as also that of the *Greekes* to bury them whole in the ground: would to excell them take another way to preserve their bodies, (expecting a resurrection as it is thought) from either fire (which as they were taught by their Philosophers was a monstrous beast, that devoured all things untill it was full, and then perished or dyed with that which it had devoured) or water, or earth that wormes should not consume them, and therefore with Nitar as with salt they preserved the carkase from corrupting and stench, and with that Tarre, and Tarre water, called *Cedria* (which was made from the stickes of both the Cedars burnt, as is used to make Pitch, and Tarre, from Pine and Pitch tree stickes with us) they besmeared oftentimes the body all over, and wrapping them in many fouldes of linnen, which did so burne as it were, and consume by time all the moisture both of flesh and bones, that it became wholly blacke, as if it had beene burned in the fire, and hard that it was not to be parted in sunder without strokes and beating; but those things that were put into the belly of the dead bodie, could not preserve the whole body, and make every part blacke alike, as I thinke. All the dead bodies of *Egipt*, and *Syria* likewise being thus embalmed were they never so poore, but with more sumptuousnesse and cost peradventure, of Aloes, Myrrhe, Saffron, Balsamum, and other precious things, if they were rich, or the Princes or Kings & were carryed into a desart or barren place in *Egypt*, and laid with some monument or heape of stones on them, which is the place where the Pyramides now stand (as it was the custome in all places to bury the dead in those places which were most barren, and not fit for husbandry, tillage, or pasture) and is about foure miles from *Cairo*, the River *Nilus*, or some branch thereof being betweene, which they must passe over either by bridg or boate, before they come there, and this as it is most likely, was the originall of the *Greekes* fables of *Lethe*, *Stix*, *Charon*, *&c.* The store of *Mumia*, that hath, and is yearely spent in all Countries, doth testifie the innumerable store of bodies buryed there sought for and brought from thence, which are all alike in substance, without any great or manifest difference. There hath beene much controversie hereabouts, the *Arabians* taking *Mumia* to be *Pissalphaltum*, and so did *Matthiolus* also, *Brasavolus* to be *Asphaltum Iudaicum*, and to be used instead thereof, which *Matthiolus* misliketh, and seemeth to allow better of the *Pisasphaltum*, or the Aloës, Myrrhe &c. wherewith the bodies were stuffed, being altered in time by the moisture of the carkase in the grave, as is before said then of the body it selfe, which is called *Mumia*, and therefore would have bodies to be so embalmed and kept, that the embalmings might be used, but assuredly, neither the one nor the other can be called *Mumia* rightly, nor are of that effect, for although *Serapio* and *Avicen* say that *Pissasphaltum* and *Mumia* are all one, and therefore whatsoever property *Dioscorides* appointeth unto *Pissasphaltum*, the same they attribute unto *Mumia*, which was their errour, yet *Galen* and *Paulus Ægineta*, by saying that *Pix liquida*, is a fit substitute for *Pissalphaltum* doe intimate that it is of another quality then *Mumia* is, and commeth farre short thereof: It is hot and dry in the second degree, and easeth the paines in the head, comming of cold and moisture, the Megrome swimmings, and falling sicknes taken in a decoction of Marjerome, & helpeth a cough taken in ptisane drinke, it is cordiall for the heart and preventeth the danger of poyson, or the venome of the Scorpion and other serpents, dissolveth winde both in the stomacke, spleene and bowels, stayeth the hickocke and bleedings, both inward and outward, dissolveth the congealed blood of bruises by fals or otherwise, and helpeth the ulcers of the bladder, and the retention of urine, being taken in Goates milke: it is also very profitably used against palsies, crampes, and distentions of the mouth the hardnes and shrinking of the sinews, and lamenes in the feete through cold and wet.

Mumia. Mumme.

CHAP. XL.

Myrrha. Myrrhe.

MYrrhe is the gum of a certaine tree growing in *Arabia Æthiopia*, and other places, as it is thought *Theophrastus* and *Pliny* declare the various reports of the face or shew it beareth, one contrary to another, so that it may be doubted whether any of them be true, seeing they be but guesses at the likelyest report. I have not heard or read, that any now adayes hath seene the tree that beareth it. *Dioscorides* saith that it is not unlike to the *Egiptian* Thorne, meaning *Acacia*, without mentioning any report, and is gotten

ten by cutting or wounding the tree, that the gumme may flow forth, in the canicular dayes, as other gummes are gotten. We have many sorts thereof, in good neese some better or worse then others, as in great and small peeces, fat and dry, pulverilentous like, pale and more red all alike, or else discoloured, with some whitish peeces in it, which is the best, for whereas *Dioscorides* commendeth that which is somewhat greene, I have not seene any such, nor read that any hath ever seene it, and it is very likely that the Greeke word ὑπόχλοες, which *Dioscorides* useth, may be used *pro colore pallescente*, as well as *subviridi*, and so *Rondeletius* noteth it in his Chapter *de Gobio pisce*, and to be taken here in the former sence. Myrrhe as I said before is in sight so like unto *Bdellium*, that they are soone mistaken by those that are not expert, but hath these notes and differences: it is extreame bitter, and so is not *Bdellium*, it is paler, fatter, easier to be broken, and of a more quicke sharpe sent, so that the best Myrrhe, may be both knowne of it selfe and hereby from *Bdellium*, that it is of a purplish browne colour, in great peeces and fattish (for the greater peeces retaine their fatnesse longer, and are not so soone dryed by the ayre) with some whitish peeces or veines therein, extreame bitter in taste, and smelleth somewhat sharpe and bitter withall. Divers have diversly thought of Myrrhe, some supposing Myrrhe to be *Benzoin*, and *Bdellium* to be Myrrhe, and that we had no true Myrrhe, *& e contra*, that we had Mirrhe and no true *Bdellium*, because so little that was good, was formerly brought to be used, that they might be plainely distinguished, and the rather because that *Galen* saith Myrrhe, will be sometimes changed into *Opocalpasum*, which is venemous and deadly, and is so like it, that as he saith in his time many were killed therewith, who yet finding it to be very effectuall for sundry diseases of the eyes, thought it might be as effectuall for inward diseases: the notes of which *Opocalpasum* (as *Galen* calleth it, or *Opocarpasum* the juyce of *Carpasum* as *Dioscorides* calleth it in his sixth Book and 13. Chapter among the venemous plants, but maketh no description thereof in any of his former Bookes) as I finde them set down in *Weckers Antidotarie* in the examination of Myrrhe) are these: because saith *Wecker* true *Opocalpasum* is not usually to be seene to compare it with Myrrhe, yet if you shall perceive in Myrrhe some peeces to be much differing both in sent and taste from true Myrrhe, you may wel & not without good reason judge that it is changed into *Opocalpasum*, for although both in colour and substance it be like to the best Myrrhe, with whitish veines therein like unto the nailes of ones hand, yet examining it more thoroughly, it will be found not to be Myrrhe, and that there will likewise some reddish cleere spots appeare therein: it behoveth therefore to be cautelous in the choyse of Myrrhe, that you be not deceived with the shew or likenesse, but observe that it have all the true notes of true Myrrhe, least while you thinke you have the true Myrrhe, you have this poyson, if it be inwardly taken, which consumeth the corrupt mattering and watering of the eyes to be used outwardly: which metamorphosis (if it be true, or that *Galbanum* should be changed into *Sagapenum* or *Cassia* into Cinamon were very miraculous yet herein the old Authours are very frequent, but I thinke of these miracles, which are the conversions of substances, as I doe of their transmigration of soules) *Dioscorides* maketh no mention of it, but saith that the juyce of *Carpasum* (whether herbe or tree) was venemous as *Taxus*, *Cicuta*, and many other was, and to be cured with the same remedies that *Cicuta* was. *Dioscorides* saith that out of the fattest Myrrhe called *Pediasimos*, being pressed is taken *Stacte*; yet *Pliny* saith that the trees doe sweate out *Stacte*, of their owne accord before they be cut, which is accounted to be the *Styrax liquida* of our shoppes, both by the *Arabians* and other later writers as *Matthiolus* saith, himselfe also being of that opinion, whereof I cannot but mervaile that he or any other duely considering our *Styrax liquida*, both the forme and sent so farre differing from Mirrhe, should thinke it to be pressed out of fat Myrrhe, being of so fine a sharpe bitter aromaticall sent, and the *Styrax liquida*, rather loathsome then pleasant. *Dioscorides* maketh mention of one sort of Myrrhe called *Aminnea*, which *Galen* calleth *Minea* (*Matthiolus* taking them to be divers, and not one sort of Myrrhe) which some thinke to be the Gumme *Anime*, called by the *Portugalls Gum Amijmum*, comming from *Ethiopia*, for there is another of the West Indies whereof I shall intreate hereafter, but herein I thinke they are deceived. *Galen* saith that Myrrhe is hot and dry in the second degree, and therefore is good for wounds in the head: and by the bitternesse which is not little, it killeth the wormes in the belly, and the living childe, expelling the dead: it hath in it also a binding quality, whereby being mingled with eye medicines it helpeth ulcers and great scarres, and for the same cause is good to be put among those things are good for an old cough and shortnesse of breath, the bitternesse not harming the winde pipe or throate, but gently clensing and heating, it helpeth the roughnesse of the winde pipe or throate, saith *Dioscorides*, and those that are hoarse, and have lost their tongue as we call it: it is good also against the paines of the sides, the laske and bloody flix, and rheumaticke destillations; it speedily procureth womens courses and mollifyeth the hardnesse of the matrix; it also taketh away the shivering fits of agues, being taken two houres before it come: but *Matthiolus* saith that by taking a dramme of Myrrhe in Muscadine, using it three times, an houre before his fits, he was cured of a quartaine ague, but he did therewithall presently after the taking thereof sweat moderately in his bed: pilles likewise saith he made with it and Treakle, is effectuall for the same purpose, to take one at a time as bigge as a pease, an houre before the fits for many dayes together: it is also a great preservative in the Plague or pestilence, and against the venome or poyson of Serpents and harmefull creatures, and therefore is put into Antidotes and counter poysons: it is a singular remedy for a stinking breath, fasteneth loose teeth, and

Myrrhe truncus cum Gummi.

stayeth

ſtayeth the ſhedding of the haire, being uſed with *Ladanum*, and the wine of Mirtles, it helpeth mattering eares and watering eyes, and taketh away the filme or skinne that beginneth to grow over and darken the ſight, it helpeth to breede fleſh in deepe wounds, and to cover naked bones, *Matthiolus* commendeth it as a ſingular *fucus* for the face to take away wrinckles that come by age, and to make it ſmooth and youthfull to be made into an oyle as it is called, or rather the liquour of Myrrhe, which is made with egges boyled hard, cut in the middle, the yolkes taken forth and filled up with pouther of Myrrhe, then put into a glaſſe and ſet in a Wine celler or moiſt place, and with this liquour to be bedewed: As alſo another way, that is, by ſprinckling with white wine, a new iron diſh or pan made hot in the fire, and taking firſt the fumes thereof unto the face, being covered over with a cloth, and then the fumes of Myrrhe in pouther, afterwards caſt on it being heated againe, and the head covered as before, and this ſtill to be uſed before bed time, for eight dayes together.

CHAP. XLI.

Nardus Indica ſive Spica Nardi. Spicknard.

GArcias ab Orta, intreating of this Spikenard teſtifieth that there is but one ſort knowne, and uſed as well by the Indian and *Turkiſh*, as the *Perſian* and *Arabian* Phyſitions, and although ſome would intimate that this is not that was uſed by the Ancients, in that *Pliny* ſetteth it downe *lib* 12. *c.* 12. that it was not to be had but at an exceſſive price, yet that hindereth not, in regard both all the Countryes of the Indies are better husbanded then heretofore, and eſpecially that ſince the *Portingalls Caravans* being exceſſive chargeable by their long journey and travaile, but I thinke both the Drugges and the Indies, by being more ſought by *Venetians* and other Chriſtians was the beginning of the reformations, for when *Arabians* and the like were the chiefe Merchants, much bad Merchandize was dearely ſold, howſoever cheapely bought, and I thinke much more adulterated both by them and Iewes, and the Indians alſo were not behind to ſophiſticate whatſoever they could, which the Chriſtians I verily ſuppoſe did ſomewhat alter, when they became great Merchants for *Europe*, and ſince is rectified more and more, when onely the ſincere and pure is bought, and the other left on their hand to mend if they can, but yet it falleth out that the blinde eateth many a flye, I meane the ignorant is often deluded, who through covetouſneſſe oftentimes letteth paſſe the better to take the worſer at cheaper rates: but to the purpoſe in hand. This Spicknard groweth not in many places, and where it doth, it is not very plentifull; it is a roote yet called a Spike, becauſe it ſhooteth up hairy ſtalkes of hairy like Spikes, many ſet together, of a browniſh colour, and whereas *Dioſcorides* ſaith the roote is of no uſe, yee muſt underſtand the word in a double ſenſe: the rootes that *Dioſcorides* meant, be the ſhort fibres, whereby it draweth its nouriſhment and encreaſe from the earth, and theſe indeed be unprofitable and of no uſe; but the rootes that *Galen* ſpeaketh of, are the Spikes themſelves or Spicknard, for ſo he calleth them both, *lib.* 1. *De Antidotis*, thus ſaying; *Iubet Andromachus adijcere Nardum Indicam, ea vero eſt quam ſpicam vocant non quod ſpica ſit radix enim eſt, ſed quod ſpicæ formam referat.* And in *lib.* 9. *de comp. med. ſec. locos.* He uſeth ſomewhat neere the ſame words: but in that ſome object, it is not of a ſweet ſent, ſuch as *Dioſcorides* recordeth of it, *Garcias* ſaith while it is freſh it is ſweete, but time may decay ſome part of the ſent, and beſides ſweete ſmells were otherwiſe taken with the Ancients then with us, witneſſe many things, as *Galbanum Allium, &c.* were reckoned ſweete, much differing from the opinions now received, but thus I have ſhewed you the acception of the roote and Spike of this *Nardus* and the ſweetneſſe: Both *Dioſcorides* and *Pena*, have recorded that it doth beare a ſtalke and leaves, yet have not mentioned what flowers it hath, neither is the other baſtard or *French* Spikenard of *Lobel* ſhewed to have any, which I have exhibited in the firſt Claſſis of this Worke, but the like was found in *Virginia* by Maſter *Iohn Tradeſcant* the younger, with ſuch like long greene leaves as is deſciphered in that, the roote alſo anſwering ſo neere unto the *French Nardus*, but of a paler blackiſh colour, and without any ſent that I could perceive, and beſides all this, he found it with the ſpike of flowers and ſeed at the toppes of the ſtalkes, which were turning or winding, the head ſtanding on a ſmall naked ſtalke, ſomewhat like (I meane in the turning) unto the *Scordo praſſum anguinum*, or *Convoluto capite*, the great Turky Garlicke with a twined head, conſiſting of two or three rowes of ſmall bright browniſh chaffie huskes, hairy as it were at their ends, and ſtanding all on one ſide of the ſtalkes, for foure or five inches long. This baſtard kinde bearing ſuch an head, doth perſwade me to thinke this

Nardus Indica. Spicknard.

this Indian kinde to have alſo ſome other, whether the like or no is not to be determined but by ſight. The properties of this Indian Spikenard are theſe: It is of an heating and drying quality, provoking urine, and ſtaying laskes, and both the reds and whites in Women: it taketh away the loathing to meate, and the gnawing of the ſtomacke uſually called the heart-burning, it conduceth helpe to ſwellings, to the ſtone in the kidneyes, and to the Kings Evill: the decoction helpeth the inflammations of the mother if they ſit therein: it helpeth to bring haire on the baire eye lids: it is not onely an ingredient into the two famous Antidotes, *Theriaca Andromachi*, and *Mithridatium*, but into ſundry other compoſitions appointed by the Ancients, but becauſe I would not make a double repetition of the ſame things, having declared the properties hereof at large in the 42. Chapter of the firſt Claſſis of this worke, I muſt referre you thereunto.

CHAP. XLII.

1. *Palma ſive Nux Indica vulgaris ferens Coccos*, The ordinary Indian Cokar Nut.

THere cannot be found in the world, a tree that hath ſo many neceſſary commodities for mens uſes to be had from it, as this Cokar Nut: the tree groweth to be huge great and vaſte, whoſe body or ſtem is covered with a ſmooth barke, bare or naked without any branch to a great height (for which cauſe the Indians doe either bore holes therein at certaine diſtances, and knocke ſtrong pegs into them which ſticke out ſo much as may ſerve for footing to get up into the tree,' to gather the juyce or liquour and the fruite, or faſten ropes with nayles round about the tree at ſpaces which ſerve as ſteppes to goe up into it) and toward the top ſpread ſundry great armes which bowe themſelves almoſt round, with large leaves on them like the Date tree but greater, whoſe middle ribbe is very great, abiding alwayes greene, and with fruite alſo; continually one ſucceeding another: from betweene the lower boughes come forth ſmaller ſtalkes hanging downe, bearing ſundry flowers on them like unto thoſe of the Cheſnut tree: after which ſucceed large great three ſquare fruite or nuts, ten or twelve, or ſometimes twenty thereon together, as big as ones head, or as a ſmall Pompion almoſt round, but a little ſmaller at the end, covered with a hard tough darke aſh-coloured barke, and within it an hard round wooddy browniſh ſhell, but blacke being poliſhed, having at the head or toppe thereof three holes, ſomewhat reſembling the noſe and eyes of a Monckey, betweene which outer barke and this ſhell, grow a number of groſſe threds or haires, or ſuch like ſtuffe, whereof is made cordage, ſtronger and more durable in the ſalt Sea, then any made of hempe; within the wooddy ſhell, there is a white kernell, cleaving cloſe to the inſide thereof, of the thickeneſſe of ones finger or thumbe, or thinner, as ſweete and pleaſant as an Almond while it is freſh, having in the middle thereof a pint, two or three, of cleare dainty ſweet water, as pleaſant as milke,

but as it groweth either to be over ripe, or being kept to be older, so much lesse pleasant will this liquour be, and either grow sower or thicke by time, and be quite spent and consumed, it hath beene observed that sometimes there will be floting in this liquour a small lumpe or ball, as cleere as a pearle, and very sweet in taste, which is as the sprout, which have sprung forth a stalke rising through one of the holes at the head, and rising two palmes above it hath shot forth fibres for rootes. The name and uses whereunto this tree, and the fruite, and those things that are made thereof serve, are these. The tree it selfe is called generally by the Indians *Maro*, in *Malaca Tricar*: but in *Malabar Tengamaran*, by *Avicen Giausi al hend*, which is *Nux Indica*, by *Serapio* and *Rhasis*, as *Garcias* saith, *Iarelnare*, yet that word is not found saith *Clusius* in our Bookes, but *Neregil*: the Latines call it *Palma Indica & Coccifera*, to distinguish it from the *Palma Dactylifera*, the timber whereof is not spongy or like the *Ferulas* as *Garcias* saith, but solide and firme, blacke and shining like the Wallnut tree, fit for building of houses or ships, and other things, as *Garcias* himselfe saith a little after, this tree saith *Garcias* is of two sorts (or rather as I thinke kept for two uses) the one to beare fruite, the other to extract the liquour issuing thereout, when the branches are cut, or when it is bored and received into Gourdes, or other such like things tyed thereto, which liquour they call *Sura*, and is like troubled Wine in shew, but in taste like new or sweete wine which being boyled is called *Orraqua*, and being destilled is made like unto *Aqua vitæ*, which they use to the same purpose that we doe ours, and will burne like it, and is called *Fula*, and being set into the Sunne will become good vinegar, but that which runneth last being suffered to abide in the Sunne untill it grow hard, or boyled to the hardnesse will be Sugar, which they call *Iagra*. The branches saith *Garcias* (but *Ferdinandus Lopes* saith the leaves) are called *Olla*, and serve as umbrels to keepe off Sunne and Raine, and in such like leaves, saith he, was written the first Letter that the King of *Calecut* sent to *Emanuel* King of *Portugall*, upon the *Portugals* first arrivall into his Country, they serve likewise to cover houses, to be defended from raine, the fruite is called by the Indians generally *Narel*, which is common both with the *Persians* and *Arabians*, but in *Malabar Tenga*, and while it is greene and not ripe *Eleni*, the *Portugals* call it *Coquo*, that is a Monckey, of the likenes of a Monkeys face, and from thence hath risen the word *Cocus* or rather *Coquus*, which the three holes represent, and at *Goa Lanha*, of the hairy stuffe or hardes which is next the outer barke of this Nut, called by the Indians *Cairo*, are made not only Cordage and Tackle for ships, but cawking stuffe, which is better to cawke ships then any other stuffe, and being beaten, the finer stuffe is made into girdles and cawles for women, (sailes cloathes also, but not any fine stuffe or cloath like any fine linnen) both of the meaner and better sort at *Lisbone*, as *Clusius* saith he saw and observed, but as *Garcias* saith, while this Nut is young it hath a tender barke which may be eaten, and tasteth like an Artichoke; of the browne hard inner shell, being polished and made blacke and shining, is not onely made cups, to drinke in, set in silver or other mettall, which made *Sepulveda* to draw the *Portugalls* to thinke that it doth helpe those that have the Palsie to drinke out of them, but *Garcias* saith it hath no likelihood: but being burned into coales serve the Gold smithes for their uses: who goe about in the streetes crying for worke, and carrying some necessary tooles for the purpose with them; of the inner white kernell, which is hollow, cleaving fast to the inside of the hard wooddy shell, which is an inch or two or lesse thicke, firme and fast, tasting sweet like an Allmond, they make bread especially while it is fresh, for the fresher the Nuts are, the sweeter will the meate thereof be, and doth nourish much, being good for macilent bodies, and to encrease sperme and Venery, and is good to lenefie the harshnesse of the throate, and the hoarsenesse of

Nuculæ Indicæ alter.
A little Indian Nut, and another called *Mehenbethens*.

the voyce, and eaten oftentimes with *Iagra* before recited, or with Sugar, or elſe being broken and bruiſed they draw forth a milke, like unto Allmond milke, wherewith they boyle Rice, and is as ſweet as the milke of Kine, or Goates, or elſe herewith, and the fleſh of beaſts or birds, they make certaine meates, which they call *Carib*. The freſh kernels being broken and dryed after the outer rinde is pared away, are called by them *Copra*, and is ſent as a merchandiſe into other Countryes, that have either none or not ſufficient ſtore to ſerve their uſe: which taſte much pleaſanter then any of thoſe that are brought from thence into theſe parts, it is uſed alſo as a ſtirrer up of Venery, and to encreaſe ſperme or ſeed: Out of this *Copra* or broken kernells is made two ſorts of oyle, the one preſſed forth (after the ſame manner that oyle of Allmonds is made) and is a moſt cleare oyle in good abundance, which ſerveth not onely to burne in Lampes, but to put to their boyled Rice: the other is made by putting warme water to them after they are broken to peeces and boyled, by ſcumming off the oyle that ſwimmeth above the water, after they are preſſed together, which oyle is uſed as a gentle purgation to evacuate the bowels, ſome put thereunto the pulpe of *Tamarindes*, which maketh it a little tarter, and fitter for hot and cholericke bodies, the other oyle ſerveth to mollefie the hardneſſe and ſhrinking of the ſinewes, and old paines in the joynts and for this purpoſe they uſe to put the patient after he is annointed, into a great and capatious tub or veſſell being heated, that may hold him, and therein ſuffer him to abide for a good while, untill he have ſlept therein, and this bringeth him a great deale of eaſe and comfort: but whereas *Avicen* ſaith, that it killeth wormes, *Garcias* ſaith he had not tryed it, neither thought it probable, becauſe it is well knowne, that the eating thereof ingendreth wormes, in all the Inhabitants that eate much thereof, and is a diſeaſe incident unto them: and whereas *Serapio* ſaith, by the authority of *Meſues*, that by the eating of theſe Nuts, the looſeneſſe of the belly is ſtayed; it diſagreeth not with reaſon, ſaith he, that the Nut it ſelfe, which hath much earthy parts in it, ſhould binde the body, and the oyle which is of many thinne and aerious parts ſhould looſen it: in the middle or hollow part of this kernell is contained, as is before ſaid, a great quantity of cleere ſweet liquour, pleaſant to drinke, and not bringing any offence to the ſtomacke, but rather refreſheth the ſpirits, the other ſort of theſe trees are reſerved ſaith *Garcias*, that the head ſprout or top thereof is taken to be eaten, which taſteth more pleaſantly then either tender Cheſnuts, or the head of the wild or dwarfe Date tree, called *Palmito*, and by the *Italians Cefaglioni*: The older the tree is, the pleaſanter is this head, but when it is taken away, the tree dyeth, ſo that he may well be ſaid to devoure the whole tree, that hath eaten one of theſe heads.

Nucula Indica racemoſa. A ſmall Indian Coker Nut many growing together.

This ſmall Indian Nut which *Cluſius* deſcribed ſingly, in the ſecond Booke of his Exoticks, the ſix and twentyeth Chapter, and 54. page, and the ſecond Nut was afterward ſent unto him from Mounſieur *de Peireſc*, in *Province*, but came a while after his death. The tree that beareth theſe fruites is in great account with the Natives where it groweth, for with the leaves they make their drinke, being boyled with water, and of the kernels of the fruites they make their bread, that is ſweet and pleaſant, which fruite groweth in a tuft or ſpike, many together, and all upon a great thicke ſtalke, they are incloſed in a certaine hairy huske or skinne, breaking open upon the ripening, and each one alſo hath a hairy huske or covering, under which was another ſhell or covering, not much unlike to a Filberd, being an inch long, and an inch or better in compaſſe, being firme and ſolid, not having any looſe or broken kernell within it, whereby to make any noiſe, but a firme white kernell fit to be eaten, which inner ſhell had an oylineſſe about it, like unto oyle of Allmonds.

Nucula Indica altera. Another ſmall Indian Cokar Nut.

The trée that beareth this Nut groweth in great plenty about the *Caſtell de minas* in *Ginney*, called *Palmes* by the inhabitants, being tall and as great as a good ſhips maſt, bearing leaves at the toppe, of a dozen or fifteene foote long, hanging downewards, cut in like unto Reed leaves, from under which leaves grow branches, the fruite being then as bigge as a mans head, containing within them many divers ſmall nuts greater then Plummes of a gold yellow colour, from whoſe kernels being bruiſed, they draw a cleere oyle, which they call the oyle of Palme, which they put into their viands, both for the colour and ſents ſake: this oyle brought into theſe parts groweth thicke like butter, and is very yellow, which ſome that brought it uſed for the cure of their freſh wounds, and annoynted their arteries and ſinewes pained with crampes, and convulſions, whereby they finde much helpe and eaſe. *Cluſius* deſcribeth theſe Nuts to be three ſquare, and to have three holes as it were, at the heads of them like unto the Cokar Nut, covered with a hairy huske, but the ſhell ſaith *Lobel*, is harder then a bone and blacke, whether theſe be all one I am in ſome doubt. Further it is ſaid that the Inhabitants by boring the tree, there commeth forth a ſweet liquour, almoſt like the whey of milke, unto which they put a little wild honey, and thereof make their drinke, which they call the wine of the Palme, which will inebriate being largely taken.

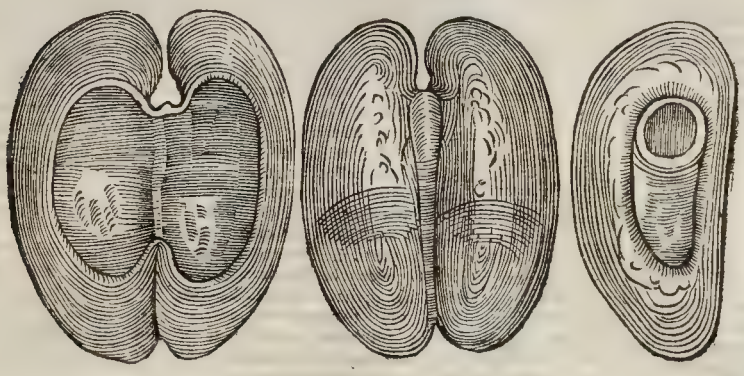
Mehenbethene. The Indian Nut *Mehenbethene*.

This Indian Nut which *Cluſius* ſaith *Cortuſus* ſent unto him for *Mebenbethene*, but did little agrée, ſaith he, unto the deſcription thereof, *Lobel* ſaith it was found among Nutmegs at *Antwarpe*: It is ſaith *Lobel* both in colour, forme, and greatneſſe like unto a Nutmegge (which therefore *Cluſius* ſaith it might be better referred to the kinds of Nutmegs, yet very untowardly I thinke) being about an inch long, and three ſquare, whoſe ſhell was hard and wooddy like a Cokar Nut, and being broken had three cels or diviſions within it, in each whereof was a ſmall long white kernell, of a ſweete and pleaſant taſte.

2. *Coccus de Maldiva.* The Cokar Nut of *Maldiva*.

This kinde of Nut is accounted as another *Coccus*, it is in many things ſo like the other, for although it was never ſeene growing on any tree, as the Indians doe report, the Nuts being onely found upon thoſe Iſlands of the *Maldiva's*, as the Sea caſteth them on the ſhores, and in no other part of the world beſides, and are not lawfull to be reſerved by any, on the paine of their heads, but are all brought to the King or his Officers, in that all wrackes &c pertaine to him, and are onely ſent by him as preſents of great account to other Indian Princes and great perſons, &c. Vnleſſe by ſtealth and concealement, ſome are diverted otherwayes, nor was never ſeene to have any ſuch rough huske as the Cokar Nut hath, yet in the inner hard ſhell, incloſing the inner kernell it is almoſt in all points like the other: the whole Nut carrying this proportion: it is farre greater, longer, and rounder then the other (yet there are of ſmaller ſizes alſo) and of an ovall forme, containing two parts which are ſo conjoyned together

Coccus de Maldiva. The Cockar Nut of *Maldiva*.



together in the middle almoſt all the length, that it is but a little ſeparate both above and below, the upper part being ſomewhat bigger then the lower, that it ſeemeth as if two long nuts were ſet together, but cannot be ſeparated by ſtrength of hands onely, but muſt be ſawed in ſunder, the ſhell being ſo hard that it ſcarſe yeeldeth thereunto without great labour, it is alſo on the outſide much blacker then the other and being poliſhed with the ſtone *Tripolo* (*Tripoly* we call it) in pouther with water, rubbed with a woollen cloath, (but not with oyle on no hand, for that will give it an evill ſavour) it will become both blacker and more ſweete and ſhining then the other, as alſo much thicker, it hath alſo two holes at the toppes, no leſſe then the other *Cocus*, and may be cut into two long boatelike cups, to be edged and footed with ſilver, &c. as every one pleaſe, or elſe each of them again cut into two other, to be bordered with mettall, the lower brims to be raiſed therewith, and the holes ſtopped, as it pleaſeth every one to doe, or to keepe them for boxes. *Cluſius* ſetteth forth in the 191 page of his Booke of Exotickes, the figure of the one halfe of theſe Nuts curiouſly ſet in ſilver, which as he ſaith, he received from *Jaques Garret* of *London*, being taken by us in a great Carracke of the *Portugals*, comming from the Eaſt Indies, which was foureteene inches long, and ſeven broad. The inner kernell hereof is alſo ſomewhat white on the inſide, but covered with browniſh skinnes both outſide and inſide, which hath ſome rifts or clefts, the outſide having none, but is much harder then the other, even allmoſt as hard as a bone, and is a little ſeparated from the woodden ſhell, which may ſoone be perceived when it is opened, but may alſo before, being as it were looſe, as may be knowne by the ſhaking: it is hollow alſo as the other, as if it contained liquour likewiſe, but was never ſeene with any being as it ſhould ſeeme, wholly conſumed by the long time before they were gotten: it hath likewiſe a ſmall lumpe, as white and cleare as a pearle, ſticking to the head of the inner kernell, as the other, which no doubt is the bud which would ſpring: the kernels on both ſides are conjoyned in the middle alſo. It is uſually called by all the Chriſtians and ſome others in thoſe parts. *Coccus de Maldiva*, by *Augerius Clutius* in his Tractate thereon, *Nux Medica Maldivenſis*, but by the Iſlanders *Tavarcare*. The properties both of the kernell and outer ſhell, is as *Garcias* ſaith, generally held to be good againſt poyſons of all ſorts and peſtilentiall diſeaſes, to be taken the weight of ten graines in fine pouther (which is beſt to be made in a morter, by beating it, for it very hardly yeeldeth to a File, or any other iron raſpe or toole, the kernell being allmoſt as hard as the outer ſhell) more or leſſe according as the caſe requireth: divers great perſonages have a peece tyed to a chaine, which they put into their drinke letting it abide therein a little while before they drinke, which they account to be as effectuall. It is alſo ſaith he, held by divers worthy perſons to be availeable againſt the chollicke palſie, and falling ſickneſſe, and other the diſeaſes of the head, nerves, and ſinewes, and by the uſe thereof, either of the drinking out of the cups thereof, or the drinke, wherein a peece of the kernell hath beene ſteeped as is aforeſaid, to keepe them ſafe and ſound from all other diſeaſes: yet *Garcias* ſcarſe beleeveth any of theſe things, and *Cluſius* as being led by his ill ſample accounteth ſuch relations to be fabulous and commentitious: but *Augerius Clutius* before ſpoken of, in his tractate of this Nut is bold to publiſh the ſundry cures he performed hereby, that is, both the Nut and the ſhell, not onely for the poyſon of Arſenicke, but in Feavers. Epilepſies, Cachexia's, and many other diſeaſes there mentioned, but eſpecially in the ſore and tedious travailes of child-birth, giving halfe a dramme of each, or two ſcruples for *adoſe*, either alone or with other *co-adjutors*.

Some thing yet remaines, wherein I would deliver mine opinion concerning ſome particulars, belonging to this Hiſtory of the Nut of *Maldiva*. Firſt concerning that opinion is held, that all thoſe Iſlands have beene formerly joyned to the Continent, which is ſaid to be 150. Leagues diſtant from them, and broken away by tempeſts, and innundations, which may be as likely as that our Iſle of great *Brittaine*, was alſo joyned to the Firme land of *France*, and both I thinke alike true, for *Cæſar* found them thus in his Progreſſe hither, and the Sea hath not in this part gained from the Land, as can be ſhewed by any good Record. Then that theſe Nuts becauſe found onely upon the ſhores caſt up by the Sea, that the trees either grow on ſome of the drowned Iſlands, their rootes abiding ſtill firme in the ground, yeelding the fruite yearely, and ſo ſwimming to Land is taken, where the winde and waves drive them, or that they grow in the bottome of the Sea, as Amber doth, which may be both alſo alike true, that is neither. Againe, that there is a certaine Iſland called by them *Palloyes*, whereon ſome others thinke that the tree that beareth theſe Nuts ſhould grow, and falling when they are ripe, are carryed

by

by the winde and waves to thoſe Iſlands are next thereunto, (which I thinke in ſome part may be probable) but that they adde, that this Iſland is ſeene by ſome that looke not for it, but cannot be found by them that ſeeke it, although as they ſay, the King hath cauſed ſundry times ſearch to be made for it, ſtill they that have beene ſent have returned affrighted and terryfied by ſpirits, that they have given it over and returned with ſuch anſwers, which in my opinion are meere fables and noyſed of purpoſe to keepe the Nut in more eſtimation. But in my judgement if the truth might be ſearched exactly, by ſtout and not timerous perſons, by religious not ſuperſtitious, as moſt of the Indians are, and by judicious and induſtrious men, and not weakelings, and fooles, the tree that beareth theſe fruites would be found to grow on the Land, whether Continent or Iſland is no matter, and that if it be true that theſe Nuts are onely found on the ſhores, as the Sea caſteth them up, for even of that report I am more then halfe doubtfull) when they are ripe and falne, the Windes carry them from off the Land whereon they are falne, into the Sea, and ſo are taken up on thoſe Iſlands: but yet me thinkes it is ſomewhat hardly to be beleeved, that theſe Nuts ſhould be carryed by the Sea to the coaſtes of no other Countries, but theſe Iſlands although they be ſo many, for the report is that they are not found in any part of the world beſides. And laſtly, to finiſh this tedious diſcourſe to ſhew my opinion how theſe (if they be fables) may be blowne away, and the truth certainely knowne, *viz.* if either theſe Iſlanders, that is, the King, or ſome of the Naturalls, or elſe ſome Chriſtians, or others in thoſe parts would make choyſe of the freſheſt they could finde of theſe Nuts, and to put both divers of them, and at ſundry times into the ground, to ſee whether they would not ſprout forth, and ſpring, for it is probable, that as they are in the inner kernell, like to the ordinary Cokar Nut, which hath a bud therein that hath and will grow, as is ſhewed before, This Nut alſo ſomeerely reſembling it, as is ſhewed, might at one time or another ſpring and grow, and take away all other doubts and fables, whatſoever are forepaſſed: This my opinion how it will be accepted I know not, but if any by the tryall thereof ſhould raiſe a tree or more, it would prove a worke no leſſe gainefull then memorable to all poſterity.

CHAP. XLIII.

Nux Moſchata. The Nutmeggē tree,

THe Nutmeggē tree, and ſo likewiſe the fruite arē of two ſorts exactly obſerved by *Cluſius*, and by him called *mas* and *femina*, the *mas* beareth the greater and the longer Nutmegge, the leſſer and rounder the female, and the moſt ordinary with us, the tree whereof is reported by them that have ſeene them, to be very great, and as tall allmoſt as our Peare trees, ſpreading many branches, which are greene while they are young, having faire broad leaves ſet thereon, ſomewhat longer then Bay leaves, or to compare them more truely, like unto the Orrenge tree leaves, but without the lower peeces, and

Nucis Moſchatæ ramus genuinus.
A true branch of the Nutmegge tree, with the fruite.

Nux Moſchata ſeu fructus integer conſiſus cum tegumento Macis, cortice nigro & nuce interiore rotundo & longo.
The whole Nutmegge cut in the middle, the hard ſhell with the Macis both on it, and of it, and the Nutmegs both long & round.

not

not so hard nor dented about the edges, but set on a short stalke not one against another, but unequally on the branches, and abide alwayes greene thereon, the fruite (for flowers have not beene observed) groweth at the end of the young branches, and not as *Matthiolus* setteth them forth, among the leaves, which are as bigge as Peaches, standing singly for the most part, but sometimes two together on a long thicke footestalke, having an outer thicke huske furrowed in the middle, which divideth it selfe into two parts, and growing ripe openeth it selfe, shewing the Nut within, covered with the Macis, cut into severall peeces as it were, and so strictly cleaving to that blacke hard shell whereon it lyeth, that it leaveth the print of the lying of it thereon, and is of an orient crimson colour, while it is fresh and the huske newly separated for it to lye open, but by little the ayre changeth the colour to be more dead and yellowish, as we see it brought dry unto us, being taken of from that blacke, thinne, hard shell, that encloseth the Nutmegge it selfe within it, which is somewhat round and firme or solid, diversly discoloured in veines within, somewhat heavy also, I meane the best, and not light or hollow, and yeelding an oylie moisture upon the pricking thereof with a pinne or needle, and of an excellent aromaticall both sent and taste, yet not so quicke and hot as either Pepper, Ginger, or Cloves.

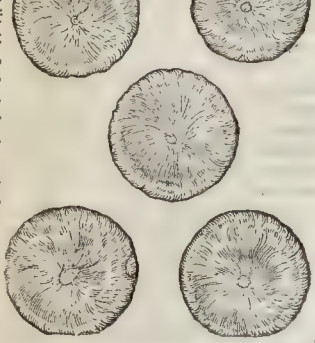
The other whose Nutmegge is longer and accounted the male, a branch whereof *Clusius* exhibiteth a part from the other, and describeth it as he received the branch, which was of a foote and an halfe in length, and as thicke as a writing pen of a goose quill, retaining some of the old wood of the last yeare, whose barke was of an ash-colour, but the new sprung branch of a brownish red colour, and very pithy in the middle, this branch had seven or eight leaves on it, being much larger and with a thicker footestalke then the former, and were neere a foote long, but not much thicker then they, and three or foure inches broad, somewhat hoary underneath and greene and shining above, with divers veines thwarting the middle ribbe: the fruite groweth in the same manner as the former, at the ends of the branches, but more in number set together, in all things like the former, but longer and greater, and nothing so aromaticall in sent and taste, yet it is said that the Macis of this sort is much more orient in colour then the last. They have received sundry names, for in *Banda* where they grow best they call them *Palla*, and the Macis *Bunapalla*, but in *Decan*, *Iapatri*, and the Macis *Jaifol*: of *Avicenna Iausi band*, that is, *Nux Bandonsis*, and the Macis *Besbase*. This was not knowne to the ancient Greeke writers, *Theophrastus* or *Dioscorides*; no nor to *Galen* or *Pliny*, for although some have thought it might be *Galen* his *Chrysobalanos*, yet they are farre awry therein, the later have called it *Nux Aromatites*, *Nux Myristica*, and *Moschata*, as if it were derived a *Musco*, for the sweetnesse thereof. They are used in all the cold griefes of the head or braine, for palsies, the shrinking of sinewes, and the diseases of the mother, they are hot and dry in the second degree, and are somewhat astringent, serving to stay the laske, they cause a sweet breath and amend a stincking, they helpe to discusse winde, either in the stomacke or bowels, it helpeth to quicken the sight, and to comfort the spirits, and provoke urine, and are comfortable to the stomacke, and helpe those that are feeble or macilent to grow fat as also helpeth Venery and encreaseth sperme, they helpe to procure rest and sleepe by allaying the distemper of the spirits, being applyed to the temples. The Macis are of the same property, but somewhat more warming and comforting, the thicke oyle that is drawne both from Macis and Nutmegges, are either of them of good use in pectorall griefes to warme a cold stomacke, and the cough, and to dry up rheumaticke destillations of raw and cold flegme thereunto or upon the lungs. The chimicall oyle of either is of more efficacy both for pectorall and cephaticall diseases, but must be cautelously and sparingly used.

CHAP. XLIV.

Nux Vomica. The Vomiting Nut or *Nux vomica.*

ALthough we have no true knowledge of the tree that beareth these Nuts (as they are called now adayes ordinarily in our shops) more then what *Serapio* saith of it, that the tree of the *Nux methel*, is like the tree of the *Nux vomica*, whereby we thinke that our *Methel*, which is the *Stramonium minus* with us so called, is the *Methel* of *Serapio*, but are much deceived, for his differeth much from it that we so call, in that *Serapio* saith of his *Methel*, that it beareth an oily fruite like *Mandragoras*, with an hairy skin or barke, and of no unpleasant taste, and of his *Nux Vomica* he saith also (differing notably from ours) that as one *Abraham* had informed him, it was a fruite bigger then an Hasell Nut, full of nodes or bunches, and of a colour betweene white and blew, and speaking of the properties of them both, he saith that the *Methel* is cold in the fourth degree, so that if two drams be taken inwardly it killeth, if a lesser quantity it causeth a kinde of stupefying like drunkennesse: and of the *Vomica*, he saith onely that two drammes thereof taken with a decoction of dill, or with salt, doth marvellously provoke vomit, but giveth no deadly quality unto it, as he doth to the *Methel*: whereby it is thought that his *Methel* is our *Vomica*, and that his assimilating it to Mandrake is rather to be understood of the quality then of the forme, whereunto it answereth, but *Avicen* describeth the *Nux Methel* to have short and thicke prickles upon it, and a seed like unto Mandrake; and such indeed is the *Stramonium* so; that you may plainely see that *Serapio* confoundeth both these together, both for forme and property: and is likely that he never saw either of them, and therefore the Physicians and Apothecaries were in former times as much mistaken in appointing the one for the other: both *pro & contra*: but now seeing that they are better knowne, and well distinguished in sunder, they are used each according to their property: yet because

Nux Vomica. The Vomitting nut.



the

the fruite or nuts are not vſuall in our ſhoppes, but hath beene formerly appointed to bee put into Antidotes and *Alexipharmica's* (as namely into the *Electuarium de Ovo*, according to the Phiſitions of *Auguſta* their receipt: but for their dangerous qualitie thought fit by our Phiſitions in the *Pharmacopœa Londinenſis* to be expunged and left out) I thought good to ſhew you them and the uſes they are put to for the moſt part with us: The fruit, as is generally ſeene are flat, round, of the thickneſſe of halfe ones finger, almoſt like unto Lupines but greater, hollowiſh on the one ſide, and a little bunched round on the contrary, of a grayiſh colour with a kinde of Freeſe or ſoft Cotten covering the whole, and of ſo hard a horny ſubſtance that they will no way bee beaten into pouther, but muſt be grated on a ſmall Spice grater, but take heed not to grate Spice thereon after. The chiefeſt uſe that they are put unto is to kill Dogs and Cats, and other creatures, by mixing ſome of it with their meate; as alſo to give unto Crowes, Ravens, and other ſuch like troubleſome birds that by their noyſe diſquiet mens ſleepe or ſtudies, or upon pleaſure to ſtrew thereof upon fleſh, a little ſprinkled over with *Aquavitæ*, tied faſt to ſome ſtake or other ſuch like thing, which will make them after they have eaten thereof ſeeme as it were drunke for a time, tumbling off from the poaſt or tree upon the ground, there fluttering for a while untill the operation is paſt and then they will flye away. Some that give it inwardly three or foure graines at a time ſay that it expelleth peſtilentiall vapours from the heart, and procureth ſweate but not vomit as farre as I can learne, notwithſtanding the name, and therefore *Matthiolus* would have it called *Nux Canina* rather then *Vomica*.

CHAP. XLV.

Olibanum ſive Thus. White Frankumſcēnſe.

HE generall tenet both of old or ancient and new writers is, that the Francumſcence tree doth grow in *Arabia*, yet *Dioſcorides* ſaith in *India*, but *Garcias* ſaith none groweth there; and as ſome ſay, the Mirrhe and Frankumſence grow in the woods promiſcuouſly together, but the deſcription of the tree in particular was kept cloſe (as it was anciently related) religiouſly by thoſe that gathered the Gum, but thoſe no doubt were but meere fables and tales to hold it in eſtimation, as that of the religious *Aſſirian* youth, ſlaine through envy, and therefore *Thus* the more accepted by the gods; for ſince the rites of Gentiliſme here ceaſed, and Turciſme crept in place, the knowledge thereof by acceſſe unto places is as hard now as before, onely *Theophraſtus* ſaith the leaves are like Bay leaves: but *Thevet* maketh it like the Pine tree, and *Garcias* ſaith that it is a low tree with leaves like the Maſticke tree, and that the Gum of the mountaine ſort is the beſt, and laſtly, *Lobel* and *Pena* in their *Adverſaria* give us the figure of a ſtrange leafe to bee the leafe of this tree which conſiſteth of a double fould from the lower end, where it is ſmall and pointed, to the toppe being broad and wide, like unto a Funnell, having as it were a ſmall flippet or peece hanging down, which of all others is the moſt unlikly to be the leafe of this tree, the forme being of ſuch an extraordinary likenes, and may more likely be the leafe of *Cluſius* his *Limonio conger*, as I have before ſhewed you. I have therfore here given you the figure of the tree as *Lugdunenſis* ſetteth it forth. Some have thought that the bark of this tree may be the *Narcaphthum* (which as ſome ſay ſhould be rather *Naſcaphthum*) of *Dioſcorides*, and called *Thus Indæum*, for the Iewes uſe it as Incenſe, and to ſuch uſes *Dioſcorides* ſaith it was applyed, and for the Mother in women. The Gum droppeth from the tree in reaſonable plentie into round peeces, ſome bigger and leſſer then others, and ſcarce any exceeding the end of ones thumbe, the beſt is pure, without eyther barke, wood or any other thing, white, yea and the whiter the better, reaſonable gummy or fat, not dry like Roſſin, and conſuming quickly and wholly into ſmoake. It is hot in the ſecond degree and dry in the firſt and binding withall. It reſtraineth bleedings, ſtoppeth the laske and the Gonorrhea, helpeth the memory, avoideth ſadneſſe and melancholly, and comforteth the heart mixed with other things for that cauſe; it is alſo very pectorall and good for the cough, for thinne rheumes and diſtillations, and the Pluriſie alſo, mixed with conſerve of Roſes and taken faſting, the fumes thereof when it is burned, being taken in at the mouth and noſe, the head being covered is very availeable both for the Cough of the Lungs, and thoſe thinne diſtillations thereon cauſing it: the fumes thereof taken beneath, or the application of it in ointment, helpeth the Piles and the *Tenaſmus*, which is a diſeaſe provoking one often to the ſtoole without doing any thing, it is a ſingular good medecine for the redneſſe and paines in the eyes, or in the eares: Mirrhe and *Olibanum* mixed with the white of an egge being beaten and laid on the temples helpeth the Megrome and paines in the head: it is of eſpeciall uſe and account in Balmes, Salves, Plaiſters, and Ointments for wounds and Vlcers, after their clenſing to incarnate and heale them ſpeedily, and in fractures of the skull moſt effectually, ſo that the *pia mater* be not periſhed. The barke

Arbor Thuriſera.
The *Olibanum*, or Incenſe tree.

of

of the tree was in former times in much use by the ancients but is utterly neglected now a dayes which was more drying and binding then the Gum it selfe: they had also *Manna Thuris*, which some tooke to be a sort of that dewy Manna that is gathered from trees but were deceived, for it is but the small peeces of pouther of the *Olibanum* which is broken by the carriage: they used also the *fuligo* or soote of it when it was burned being made as blacking for shooes, &c. is made, but is wholly out of use now adayes.

CHAP. XLVI.

Piper ejusque species nigrum album longum, &c. Divers sorts of Pepper, as blacke, white and long, &c.

HOw *fabulous* and untrue were the relations of *Indian* Drugs brought to the ancient writers, *Dioscorides* and others may be plainely discerned, by their description of the plant of Pepper, and the fruit thereof, for *Dioscorides* saith of it, that it groweth on a small tree, and that the fruit at the first is long, which is the long Pepper, having within it small graines like unto Millet seede, which in time growing ripe becommeth blacke Pepper, by spreading forth the branches and the graines of Pepper upon them as they are seene: and that the white Pepper is taken before it is ripe, the roote is like unto the *Costus* and not to *Ginger* as some say, thus farre he: but the truth is farre otherwise: for Pepper, whether blacke or white differeth not either in manner of growing, nor in forme of leafe or fruite; the long also groweth after the same manner, but differeth in the fruit: now all the sorts are sufficiently knowne by our Navigations and frequent transficke into the East *Indies*, to grow each on a severall climing bush, but after one manner, that is, as Hoppes doe with us, so that if they be not sustained by some tree, pole, cane or the like, whereon they may clime and spread, will lye downe on the ground, and thereon runne and shoot forth small fibres at every joynt, as hath beene truely observed: but the usuall manner is to plant a branch taken from the bush, neare unto some tall and great tree, or as I said some great Cane or such like, and so it will quickly by winding it selfe about it (but not with tendrells as a Vine doth) get to the very toppe thereof, being full of joynts, and shooting forth faire and somewhat large leaves one at a joynt, being almost round, but ending in a point, greener above and paler underneath, with a great middle ribbe, and foure other ribes somewhat lesser, spreading from it two on each side, and smaller veines therein also unto the edges which are not dented but smooth and plaine, not thicke but somewhat thinne, and set on a pretty long footstalke, the fruit or Pepper it selfe, whether blacke, white, or long, groweth at the same joynt, but on the contrary side opposite to the leafe, and not betweene the stalke and the leafe, as some have falsly set it downe round about a long stalke, somewhat thinly set all along thereon, or not so thicke as a bunch of Grapes: the roote hath sundry joynts creeping in the ground with fibres at the joynts, the white Pepper is very hardly

Piper nigrum vel album.
Blacke or white Pepper.

Piperis albi ramus.
A branch of white Pepper.

distinguished

distinguished from the blacke by the very inhabitants and planters thereof, untill it come to ripenesse (for the white and the blacke Pepper doe grow on severall trees or bushes) but that the leaves are of a little paler greene colour: the graines or berries are white, solid, or firme without wrincles, and more aromaticall. *Clusius* first and *Bauhinus* from him would make a certaine strange fruit brought to *Clusius* to be the *Bresma* or *Brasma* of *Dioscorides*, as *Lib. exot. 2. cap. 22. fruct. 4.* but surely *Clusius* and *Bauhinus*, yea and *Cordus* also as I verily thinke were deceived in this their opinions, to thinke that *Dioscorides Brasma* was a sort of Pepper differing from the blacke, when as it is but the light graines of Pepper that have no substance in them, as it happens to many other graines or berries, some to idle and nothing worth, and therefore wee call it light Pepper. The long Pepper hath leaves very neare to the same forme and largenesse, but a little longer pointed, of a paler greene colour, thinner also, and with a shorter footstalke, and not having foure so eminent ribs passing from the middle one, as in the other, but foure or five on each side or more sometimes according to the largenesse of the leafe, with many other smaller veines therein likewise, and of little lesse acrimony and hot taste then the blacke: the fruite of this also groweth in the same manner as I sayd before opposite to each leafe at the joynts, which are closer set together then in the blacke, some being greater or lesser, shorter or longer then others, yet none thicker or longer then ones finger, consisting of many small graines as it were set close together in rowes, and not open and seperate as in the blacke and white Pepper, of an ash colour when it is ripe

Piper longum. Long Pepper.

Fructus Piperis longum.

Piper Æthiopicum Matthioli & Piper caudatum Orientale: Matthiolus his Ethiopian Pepper, and a kind of East India fruite called Pepper with a taile.

Piper longum maritimum Africanum sive Felfel cavil Alpino. Long Pepper of *Africa*.

as is plainely seene in all that is brought unto us. The blacke Pepper is of much use both with the *Indians* and other nations for they use to eate the leaves, chawing them a while and spitting them out againe and the Pepper it selfe also doe they use to chew, and from the branch take every graine one after another while they are fresh and therein take great pleasure, we use it most in our meats and sauces to season them, and because it is moderatly hot, if not taken too much at once, it is the better accepted and more pleasing to warme the cold stomacke, and to stirre up an appetite and to consume crude and moist humours therein, or distilling from the head; it helpeth to breake and dissolve winde in the stomacke or bowels, to provoke urine, to helpe the cough and other diseases of the breast, and is effectuall against the bitings of Serpents and other poisons, and is therefore put into the great Antidots: but the white Pepper as being more hot, sharpe, and aromaticall is of more effect in medicines, and so is the long also being more used to be given for Agues to warme the stomacke before the accesse or comming thereof, thereby to abate the rigour and shaking; all of them are used against the Quinsie being mixed with hony, and taken inwardly as well as applyed outwardly, and dispereth the kernells as well in the throate as in any other part of the body. *Matthiolus* maketh mention of a kinde of Pepper, as he called it *Piper Æthiopium*, or *Æthiopicum* brought with other wares from *Alexandria* into *Italy*, and groweth in long cods like beanes or pease, but many cods set together at a place, whose graines within them being like Pepper both in forme and taste, but smaller, and sticke very close to the inside: this sort *Serapio* setteth downe by the name of *Granum Zelin*, which some erroniously tooke for *Carpesium* and some for *Amomum*. *Monardus* also maketh mention of a kinde of long Pepper that groweth in all the tract of the continent of the West Indies which is halfe a foot long, and of the thicknesse of a small rope consisting of many rowes of small graines set close together as in the head of Plantane and is blacke being ripe, and hotter in taste, more aromaticall and more pleasant and sweet then *Capsicum*, and preferred before blacke Pepper, it groweth saith he on high trees or plants.

Piper Æthiopicum *Matthiol.*

Piper longum Occidentale *Monardi.*

Piper longum maritimum Africanum sive Felfel tamil Alpino. Long Pepper of *Africa*.

This strange plant shooteth from the roote a great many low round stalkes somewhat like unto Rushes, having here and there some other smaller springing from them, like branches almost as thick as a finger, having thereon a few small leaves in the Spring time, but quickly falling away, scarcely abiding a moneth, and at the tops of some of them come forth small whitish flowers, each standing in a small long huske, in which after groweth the seed, the stalkes being cut or broken, yeeld out a whitish yellow milke or juyce, of a very hot and burning taste, more then ordinary Pepper, *Ranunculus*, or *Tithymall*, which caused *Imperatus* to referre it to the *Tithymals*. Yet some tooke it to be *Xabra*, or *Camarrones* of *Rhasis*, *Bauhinus* calleth it *Piper longum angustifolium ex Florida*.

Piper Caudatum racemosum. Pepper with a taile in bunches.

About the yeare 1590. there was brought to *Lisbborne* by the *Portugale*, from some parts of the East Indies, which afterwards wee understood to bee *Guinney*, a kinde of graine, which they called *Pimenta del rabo*, that is Pepper with a taile, and grew many together on a long stalke, thicker set then in the ordinary Pepper, every one by it selfe on a short footestalke, being blackish, round, and firme like Pepper, with a little point or end, wherein it chiefely differed from blacke Pepper, and tasting hot, somewhat like Pepper, but of a sharper and differing aromaticall rellish, and a little lesse then the best sort of Pepper, but with a rugged skinne thereon like it, whether it grew after the same manner of Pepper, none could tell that brought it, but as it is probable by the sight of some of the stalkes, they seemed rather to grow from some upright bush. The King of *Portugall* forbad the bringing home any more of that sort, lest it should villifie the other.

Piper Canarinum cavum. A hollow kinde of Pepper of *Canara*.

Garcias ab Orta, maketh mention of this kinde of Pepper, which in the *Malabar* language is termed of *Canara*. It is a kind of hollow graine, of a blewish colour on the outside, and having sundry graines within the hollownesse thereof, which the poorer sort of people doe eate, and therefore as it is thought called *Canariynum* as if you should say Rusticall or Clownes Pepper for the meanenesse thereof, and therefore not used to be exported.

CHAP. XLVII.

Santalum album, citrinum & rubrum. White, yellow, and red Sanders.

WE have in our shops for our use in physicke, onely these three sorts of Saunders, whereof the white and the yellow are sweet woods, and the yellow is the sweetest, the red hath no sent. The Saunders tree, as *Garcias* saith, groweth to be as bigge as the Wallnut tree, having fresh greene leaves like unto the Masticke tree, and darkish blew flowers, the fruite being like unto Cherries for the size, but without any taste, blacke when they are ripe, and quickely falling away, the wood it selfe is without sent, as it is said, while it is living, and fresh, and smelleth sweete onely when it is dry, the white and the yellow woods, are so hard to be distinguished before that time, as it is said, that none but those Indians that usually fell those trees, doe know their difference before hand, and can tell which will prove better then others: the chiefest part, and smelling sweetest being the heart of the wood, and as the trees doe grow in severall places, so are their goodnesse, being more or lesse plentifull in the substance of the heart, for thereafter are they accounted: The ancient *Gracians* have made no mention hereof, but the *Arabians* onely, who generally call it *Sandal*, but the Natives in the Iland *Timor*, and all the Provinces of *Malacca*, *Chandama*, and those of *Canara*, *Decan*, and *Surrat*, *Sercanda*; the Latines call that sort *pallidum*, which others call *Citrinum* from *Avicen*, who reckoning three sorts, *Citrinum Rubrum & Citrinnum alterum ve gens ad albedinem quod quidam nominant Makassari quod alij dicunt melius & validus*, which words in *Avicen* explaine the word *Makassari* which *Garcias* saith he could not understand, and the *Pandectarij* converted *odoriferum*: they of *Malabar* have a certaine sweete wood like unto white Saunders (as there are many other sweete woods in other places) but yet is not the right, although they use it as the true is, and instead thereof, calling it *Sambarane* in the *Malabar* language. The red Saunders differeth much from both the former, both in place growing farre one from another, and in forme, also colour and sent: it differeth also from the Brassill wood, in that Saunders is neither

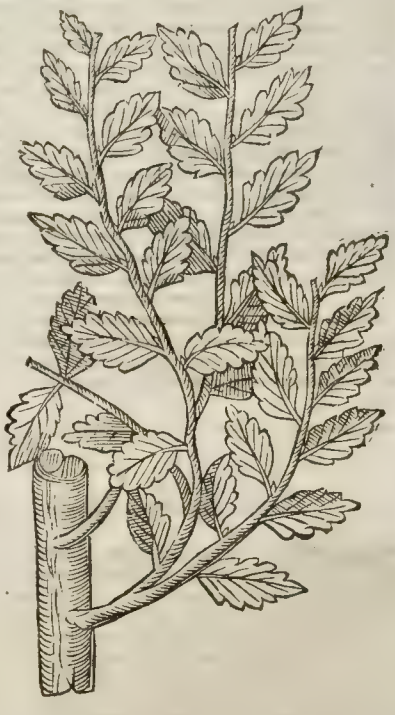
sweete in taste, nor giveth any Dye as the Brassill doth, and besides the Saunders is heavier then it, and will sinke in water, it is also a harder and shorter grained wood, and more brittle in breaking short. They are all both cooling and cordiall, and used together in sundry cordiall medicines, but the white, and the yellow are the more cordiall and comfortable by reason of their sweetenesse, and the red more cooling and binding, which quality yet neither of the other want, although in a lesse proportion; for the red is used often to stay desluxions of thinne rheume from the head, and to coole hot inflammations, hot gouts, and in hot agues, to coole and temper the heat: but the white and yellow are both cordiall and cephalicall, applyed with Rosewater to the temples, procuring ease in the head ache, and are singular good for weake and fainting stomackes, through heate: in the hot fits of agues also, they are very profitably applyed in Epithemes or Fomentations, both for the stomacke, and for the spirits, and palpitations of the heart, which also doe comfort and strengthen them, temperate the melancholly humour, and procureth alacrity and mirth, which qualities are attributed to the yellow more then the white, which is used more to stay and binde fluxes of the sperme in man or woman, for which purpose, either the pouther taken in a reare egge or mixed with other things for the purpose, or steeped in red Wine, and kept in an hot Balneo, or in hot embers close stopped all night, and strained forth and drunke in the morning and evening, both stayeth the Gonorhea, or running of the reines in men, and the whites in women: applyed also to Maides or womens great brests, mixed with the juyce of Purslane, abateth their greatnesse, and represseth their overmuch growing.

CHAP. XLVIII.

Pseudosantalus Cretica Aboliceadicta.
Bastard red Saunders of *Candy*.

Pseudosantalus Cretica Aboliceadicta.
Bastard red Saunders of *Candy*.

THis tree groweth in *Candy*, and made knowne to *Alpinus*, whose figure was sent him as I here shew it you, with this description following. It is a tree that groweth to a reasonable great height, & straight upright, furnished with many armes and branches, very beautifull to behold, set with faire greene leaves one at a place, like unto those of *Alaternus*, but rounder and deeplier endented about the edges: the flowers were not observed what forme or colour they bore; but the fruite was round, and of the biggenesse of Pepper cornes, of a darke greenish colour which were not perfectly ripe, when this tree was found. The wood it selfe is somewhat sweete, hard, and reddish so that it seemed like red Saunders especially being made into pouther from whence I thinke saith he, it may not unfitly be called Bastard red Saunders of *Candy*, some of the wood saith *Pona*, hath beene brought into *Italy*, and there sold for Saunders: but it differs from it in that it is nothing so heavy as the true red Saunders is.



CHAP. XLIX.

Sassaphras. The Sassafras or Ague tree.

THe first knowledge of this Sassafras or Ague tree came by the *French* to our Christian world, and to the *Spaniards* by driving out the *French*, who had seated themselves somewhat neere the *Florida*, which they claimed for themselves for they having gotten Agues, and swellings in their legges, and other diseases by lying on the ground in the open aire by bad victualls and raw drinke of water, as the *French* before them had, by a *French* man that remained among them, were taught the use of this tree, which he and his Country men had learned before of the Natives,

so

to helpe themselves in these extremities: some Indians call the tree *Pavame*, and some *Winanke*: but the *French* (whom the *Spaniards* and all other Nations since that use it follow) *Sassafras*, upon what ground or cause is not knowne. The tree groweth great and tall, bare of branches unto a reasonable height covered with a grayish browne barke somewhat thicke, being in taste hotter and quicker then the wood or roote by much: towards the toppe it spreadeth forth many goodly armes and branches into a round compasse or forme, having large darke greene leaves growing thereon one at a place: standing on the contrary side, each to other, tasting like the roote but more weakely, some cut into three divisions, somewhat resembling Figge tree leaves, but lesser by the halfe for the most part, with a middle ribbe running through each division, and two others to the inner cuts, with veines besides, and some with little or no division at all upon them, for both sorts wee have seene growing on the same tree, smooth also and not dented about the edges: the flowers are small and yellow made of threds very like to the Male Cornel tree as Master *Iohn Tradescant* saith and the fruite small blackish berries, set in small cups upon long footestalkes many clustring together: the rootes are not very great nor grow deepe, in the like manner as all other sorts of Indian trees doe, but are covered with the like browniish barke, that the trunke and branches are but somewhat redder, which are most in use, being of greater force and efficacy then any other part of the tree, and taste somewhat spicelike, rellishing Fennell seede withall, but *Clusius* compareth the taste thereof unto the herbe *Tarragon*, and is hot and dry in the beginning of the third degree. The decoction whereof is familiarly given in all cold diseases and obstructions of the Liver and spleene, as also in cold theumes and desluxions of the head, on the teeth, eyes, or lunges, warming and drying up the moisture, and strengthning the parts afterwards, and therefore is availeable in coughes, and other cold diseases of the brest, stomacke, and lungs, and restraineth castings, and helpeth digestion, breaketh and expelleth winde, the gravell and stone in the kidneyes, and provoketh urine, and womens courses, it also warmeth, heateth, and dryeth up the moisture of womens wombes, which is in most the cause of barrennesse, and causeth them to be the more apt to conceive: it is of especiall good use in tertian and quotidian agues that come of humours, or are of long continuance: it is thought also to be good in the time of the pestilence, to weare some thereof continually about them, that the smell of it may expell the corrupt and evil vapours of the pestilence: it is generally used in all the diseases that come of cold and raw, thin, and corrupt humours, the *French* disease, and other of the like foule nature: the Indians use the leaves being bruised to heale their wounds, and sores of whatsoever quality they be.

Sassafras. The Sassaphras or Ague tree

CHAP. L.

Spermaceti. Parmasitty.

Spermaceti, that is the spawne of the Whale, usually called in *English* Parmasitty, is found in the head of one onely sort of Whale fish called *Trumpa*, which hath no finnes in his mouth, but teeth about a spanne long, and as thicke as ones wrist: it lyeth in a hole therein, as it were a Well, which is taken out and brought home, after their fishing for Whales, in barrels, and is afterwards pressed in a presse, that the thinne oyle may runne from the thicker substance, which is that Parmasitty we use, and the more it is pressed the whiter it will be, and of little or no smell, yet the oyle is somewhat strong: this sort of Whale hath but one hole in the head, whereby it spouteth out water, all other sorts having two, his head is bigger then others, and bigger then his whole body besides, which is also of a more gray colour: in this Whales entralls, Ambergreise is said often to be found in more plenty then in other, which it is more likely that they swallow as food, finding it swimming on the Sea water, then that it should breed in them, as diverse have supposed, for I have here shewed you the generation of Ambergreece: this Whale also yeeldeth a kind of oyle, as other Whales doe, but it groweth both white and hard, when it is cold, when as all other are liquid like oyle, and never grow hard like it, and therefore it is alwayes kept by it selfe, and not put to others.

CHAP. LI.

Tacamahaca. The Gum Tacamahaca.

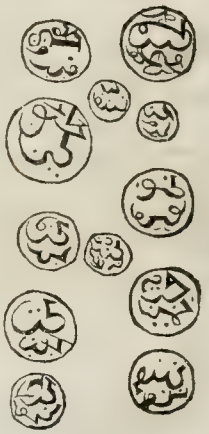
THis Gum, which the West Indians call *Tacamahaca*, the *Spaniards* and all other Nations rētaining the same name, is said to be gathered from a great tree like unto a Poplar, that is, very sweete having a red fruite or berry like unto those of the *Peony*, more we cannot as yet learne of it. The Gumme is of good and much use for outward remedies, not being knowne to be given inwardly for any infirmity, although I doubt not but that it might safely and to good purpose, if judgement were joyned with the triall thereof, but as it is now generally used, it serveth much, yea and most of all in womens diseases to retaine the Mother in its place, by laying a plaister thereof upon the navell: as also when it riseth up and is ready to strangle them, and for the strengthening thereof, some put Muske and Amber to it, or a little Civet in the middle of the plaister: This Gumme being spread on leather and applyed to the side or spleene, that is growne hard and windy, dissolveth the tumours, dispersеth the winde and bringeth much ease and helpe to the disquieted part, and is no lesse effectuall in all tumours, griefes, paines and torments in the body or joynts, proceeding of cold raw, and windy humours, applyed plasterwise thereon: to be applyed to the stomacke, with a third part of *Storax*, a little Ambergrieſe, and some waxe, is a singular helpe to strengthen the weakenesse thereof to helpe digestion, to provoke the appetite, and to dissolve wind: it is of excellent use in the head-ache, and to strengthen the braine and memory, as also in all defluxions from the head, into the face, eyes, eares or teeth, causing swellings therein, with paines, rednesse, and much perplexity, to be applyed to the temples, or put into the eare, tyed in a little fine silke or cloath: it helpeth also all running humours, and paines thereby in the shoulders or armes, or any other part of the body, the joynts likewise, goutes and Sciatica, giving besides the scattering of the humours, much ease of the paines, and by the astriction whereof it partaketh not a little, strengtheneth the parts wonderfully against the virulency of the humours: it marvellously helpeth all punctures and wounds in the joynts, and that speedily, healing them and hindering any spasme or convulsion that may happen therein, so that this gumme serveth as a remedy in most outward griefes that doe not rise from much heate, and yet therein is not defective, being warily applyed, that is in the declination of the heate to discusse those humours that remaine: for being hot to the entrance of the third degree and dry in the second, with much astriction also, it is most proper for those before recited griefes, and others of the like property. The choyse of the best is, that it be pure and cleane without drosse, cleare also, in some sort of a whitish browne colour, and more whitish in some parts, of no strong but a little quicke and sharpe sent, and quickely consuming into smoake being cast on quicke coales.

CHAP. LII.

Terra Lemnia vel sigillata. *Terra sigillata* or sealēd earth.

BEcause this is, and hath bēene a drugge of much respect and use in physickē, although no herbē, I could not over passe it, but shew you the thing, and the many doubts and falsifications with the uses thereof, that my Brethren in profession, and all others also that shall have occasion to use it, may both know the right and refuse the counterfet and false: for that is the whole scope of my labours in this Worke, *viz.* to enforme all of the genuine and right things, that they may desire, and know them, and also the best true uses whereunto they serve. First for the Place it is certainely agreed by all, that the Isle of *Lemnos* seated in the *Ægean* Sea, called by the *Italians* and others in these dayes *Stalimene*, was in all former ages and yet is in these times, the place where onely this earth is to be had, which hath beene and still is of much estimation in physicke, for the excellent Vertues therein above all the earthes in all other places, and therefore the severall ages had severall rites whereby to ennoble it the more: *Dioscorides* saith of his time that they used to mixe the blood of a Goate with the earth, which *Galen* in his time (which was long after *Dioscorides*) being desirous to know, and what proportion of blood was put to the earth, he sailed twice to *Lemnos* for that purpose, but missing of the place the first time, at the second he came both to see the place from whence it was taken, and the manner of ordering of it, which was differing from *Dioscorides* his relation, for neither blood nor any thing else was mixed therewith, and *Galen* as he saith himselfe, was laughed at by the people of the better sort, who well understood the course of their Country for many foregoing ages, for asking such a question of the mixing of Goates blood with it: but the Priest that was then ready prepared to fetch home a cart full thereof, upon his arrivall there, onely cast a certaine number of Wheate and Barley cornes to the earth, as a pacification therewith, and some ceremonious rites, according to the Religion of his Country, caused it to be carryed home, where, having put it into water, they washed the pure earth from the stones and sand, or any other thing in it, which afterwards being dry againe, they make it into small cakes, some bigger or lesser then others, and seale them with the figure of a Goate, the badge of *Diana*: and therefore they were called *Sphragida agiæ*, that is *sigillum capræ*, or *Sphragis Lemnia sigillum Lemnium*, and the La-

Terra Lemnia vel Sigillata.



tines

tine's *Terra Lemnia* or *Terra ſigillata*: Thoſe rites of Gentiliſme being ceaſed, others were brought in and uſed by the Chriſtians, and when the *Venetians* were Lords of this Iſle, as of many other in thoſe Seas, they impoſed this order, that but onely one day in a yeare the earth ſhould be digged and carryed away to be uſed: Forbidding any upon great penalties to take any privily without leave: which cuſtome the Turkes ſtrictly obſerve to this day, but the hill in this Iſle is much controverted, being ſuſpected not to be the ſame from whence the earth was taken in *Galens* time, yet the Greekes of the Iſle affirme conſtantly, they never heard or knew of any other place: The earth as *Galen* ſaith of it in his time, was called of ſome *Miltos Lemnia*, *Rubrica Lemnia*: becauſe it was in colour reddiſh like *Rubrica* Ruddle, but that it did not colour the fingers, as *Rubrica* Ruddle doth, and this the Prieſt onely as is before ſaid ſeales: Another ſort is the *Rubrica* which wee take to be our ordinary Bolearmoniacke, and ſome thinke that our fineſt and beſt Orientall Bole, is the true *Terra Lemnia*, becauſe it is of the ſame reddiſh colour, not tainting the fingers, and that the *Terra Lemnia* or *ſigillata*, that we have in theſe times much differeth from it, and very divers in it ſelfe one unto another, for ſome is whitiſh or very pale red, and that in lumpes or peeces not ſealed, others that are ſealed now adayes with *Arabian* Characters, which are interpreted *Tin imachton*, that is *Terra ſigillata*, are not without ſome doubt of counterfetting, ſo that of two and twenty ſorts of theſe ſmall cakes of ſealed earth, which *Bellonius* ſaith he had ſought out and gotten in the ſhops of the Druggiſts in *Conſtantinople*, it was hard to judge which of them, or whether any of them were right or no, for as he ſaith, ſome cakes were much greater then others, and ſome of a pale browniſh colour, of a fatty ſubſtance like tallow, eaſie to be chewed, and without any grittineſſe therein, which ſome others have, that were more red, and ſomewhat acide in taſte: Some againe had divers red ſpots in a whitiſh earth; and ſome ſmell ſo ſweete that it may be thought to be ſo made; And ſome againe of a wan colour, tending to yellow, others very gritty betweene the teeth being chewed: theſe and divers other varieties, doe ſhew that covetouſneſſe (this being of much eſteeme) is the cauſe of counterfetting, and beſides experience ſheweth us, that the earthes of ſundry other Countries are found to be of excellent properties, both to provoke ſweate, to reſiſt poyſon, and notably to dry and bind fluxes, catarrhes, &c. all which are attributed to the beſt *Terra Lemnia*, but *Galen* in his time had the tryall of the *Bolus*, or *Terra*, or *Lapis Armenius*, which you pleaſe to call it, for ſundry eſpeciall remedies wherein it was effectuall, as alſo in a great Plague time in *Rome*, which he compared to that was in *Greece* in *Thucydides* time, for as he ſaith, whoſoever tooke of that *Bolus Armenius*, diſſolved in thinne wine or water, were ſaved if they were to be ſaved, for no other thing could if that did not: and therefore ſeeing we have ſo little right *Terra Lemnia* or *ſigillata* wherein to truſt, and ſo much counterfet, whereof we have cauſe to beware, my adviſe is rather to uſe the beſt fine Bole (which both in forme and quality commeth neereſt to the trueſt *Terra Lemnia*,) then any other ſubſtitute or new found earth, going under the name of the right, although they have divers good properties in them. Let no man impute this as a temerity in me, for could I be aſſured that we could have true *Terra Lemnia*, or that the true that now is to be had were of that excellency that *Dioſcorides*, *Galen* and others report of that in their times, I would ſpare my adviſe and ſpeake otherwiſe. But ſeeing I have commended the fine Bole for the beſt ſubſtitute unto *Terra Lemnia*, let me alſo declare unto you, although I have ſaid ſomewhat before of Bole, the ſpeciall uſes of both of them, that by comparing their properties, you may ſee how little they differ in quality: The chiefeſt effect of *Terra Lemnia*, according to *Dioſcorides*, is to reſiſt the venome of Serpents, and other deadly poyſons, for which cauſe it is put into the great Antidotes againſt them, and is good alſo againſt laskes and fluxes: but *Galen* ſetteth them forth more largely, for as he ſaith, having had a Booke given him when he was in the Iſle of *Lemnos*, by one of the chiefeſt men, containing all the properties of *Terra Lemnia*, he ſheweth that beſides the remedies of venome and deadly poyſons, he had experience of the helpe it gave to thoſe that had eaten of the Sea Hare, or of *Cantharides*, defending them from all the fits that doe accompany thoſe that have taken of them, as alſo the biting of a mad dog, and that it wonderfully helpeth old ſores that are hard to be cured, and freſh wounds alſo to conſolidate them. The fine Bole of *Armenia*, *Galen* ſheweth to be admirable effectuall in the plague, as is before ſaid, it alſo is ſingular good in laskes, blooddy flixes, and ſpitting of blood, for the catarrhe, or defluxion of rheume and thinne humours upon the breſt and lungs, and ſhortneſſe of breath, marvellouſly drying and helping them, and likewiſe againſt the foule ulcers in the mouth, the ulcers in the lungs or other parts, and the fiſtula in any, without applying any other thing that might cleanſe it, or take away the callous skinne therein, this onely dryed it, and healed it up.

CHAP. LIII.

Turbith officinarum. The uſuall Turbith.

HAving ſaid ſomething before in the Claſſis of purging Plants, concerning the various ſorts of Turbith, as divers did take them, and account of them, whereof I meane not to ſpeake againe in this place, but yet I thought good here, to ſay ſomewhat more of the true Turbith, which is a forraigne Drugge, and uſed in the Apothecaries ſhops, not knowne to us or any other certainely, that hath written thereof, what forme or face the plant truely beareth, whoſe roote it is: for although *Garcias* ſaith, that he ſaw the plant growing greene and in flower (yet he ſaith himſelfe that it differeth from that which we uſe in our ſhoppes) which he deſcribeth to have no great or long roote, whoſe ſtalke is like unto Ivy, ſpreading on the ground, of a fingers thickeneſſe or more, and two hands long, and ſome times much longer: the leaves are like unto thoſe of the *Althea*, Marſh Mallow, and ſo are the flowers of a reddiſh white, and ſometimes all white, but not changing three times a day, as ſome report of it: that part of the ſtalke that is next unto the roote and is gummy, is onely uſed, the reſt being too ſmall is of no uſe: ſometimes the roote is gathered with the ſtalke, which is unprofitable, the ſtalke onely being of uſe in Phyſicke: the whole is inſipide without taſte: ſo that you may perceive by this deſcription, that this Turbith of *Garcias*, is but the ſtalke of an herbe as it ſeemeth (but our Turbith in ſhops is plainely deſerned to be a roote, yet ſomewhat ſmall, and of an aſh-colour on the outſide, and white within, having a pith in the middle, which is cut out and caſt away as un-

profitable, and ſome peeces, but not all gummy at the ends having no manifeſt taſte) which by bruiſing of it while it is greene, as he ſaith, yeeldeth forth a juyce that hardeneth into a gumme; yet doth *Garcias* appropriate this Turbith in his following diſcourſe to that which was with them of daily uſe, ſaying that the *Arabians*, *Perſians*, and *Turkes* call it all by the name of Turbith, by the Indians in *Surrat*, where it groweth plentifully *Barcaman*, and in *Canara*, whereof *Goa* is a part *Tigmar*: It groweth alſo as he ſaith in other places of India naturally wilde: but that of *Biſnager* or *Goa*, is not uſed by the Phyſitions there, but that of *Guzatate*, which is the beſt, from whence alſo as he ſaith, it is tranſported into *Perſia*, *Arabia*, *Aſia minor* and *Portugall*. In this diſcourſe of *Garcias*, I finde ſome contrariety as I take it, at leaſt ſuch intricacy, as maketh me doubt it was not ſo adviſedly written, as ſo worthy a man (whoſe Workes and labours were as directions to poſterity) ſhould have done; for firſt he ſaith that the ſtalke is of uſe, the roote is unprofitable, and yet he ſaith this very ſame is both called Turbith, and uſed by the Phyſitions there, of all nations as the Turbith of the ancients, which that the Indians gather it to ſell to the Merchants, that carry it into their Countries, and yet it was never ſeene that any ſuch gummy ſtalkes were brought into theſe parts of Chriſtendome that I can learne, and ſold by the name of Turbith. Againe, *Garcias* ſaith that this his Turbith is farre differing from that which the *Arabians* deſcribe, and namely that of *Meſues*, which he deſcribeth with thoſe notes that are moſt agreeable unto that Turbith that is every where to be found in all our ſhops, and yet *Garcias* taxeth him of erronious deſcribing of it, as though thoſe notes did not agree to the true Turbith that is brought out of the Eaſt Indies, by the *Portugalls*, into Chriſtendome, when as we never ſaw any other brought from thence, ſo that I cannot ſee how *Garcias* can be freed from the imputation of much overſight, that tooke his Turbith to be the ſtalkes, and not the rootes of the Turbith plant: for I verily thinke his Turbith and ours to be all one, and that his errour roſe onely from being too confident on his Kinſmans relation thereof, to be the ſtalkes, who as he ſaith, informed him of the plant, the manner of the gathering and uſage thereof by the Indians, and that himſelfe was preſent with the Indians, and ſaw the whole ordering of it, and is probable was but his owne conceit and fained to make *Garcias* beleeve it: for how elſe could that be differing from that of *Meſues*, which verily is the ſame with that, which as I thinke hath beene alwaies brought us for Turbith, and yet be the ſame the *Portugals* brought with them from thence, to ſerve all Chriſtendome. The notes of *Meſues* his Turbith, which as I ſaid agree ſo juſtly with our Turbith, that you may know how to chuſe the beſt are theſe; but firſt he ſaith that it is the roote of an herbe, which hath Ferula like leaves but leſſe (which how true it is I cannot ſay, *Meſues* peradventure never having ſeene the plant growing, giveth that note rather by information, which *Garcias* it may be ſheweth by his owne ſight but of the roote, which ſerved him for his daily uſe, he was an eye-witneſſe and teſtifyeth of it) and was of the kind of thoſe plants that give milke (and yet not of any Tithymall for divers other plants give milke that are not hot in taſte as the Tithymalls) and was of divers ſorts, manured, and wild, great, ſmall, white, blacke, and yellow, and growing in dry places as may be perceived by the thickeneſſe of the juyce (the gummineſſe he meaneth) and both greater and ſmaller rootes, white, and blackiſh, and yellow, are many times ſeene altogether with us (which blackneſſe or yellowneſſe may come by the ill drying of the roote, or the taking of ſome wet in the drying or after) he maketh two markes of the choyſeſt: that it be white (within) hollow within like a reed or cane (that is when the hard pith of the roote is taken out) gummy with an aſh-coloured barke or outſide, ſmooth, and not rugged, eaſie to be broken, freſh, and not very great or thicke, which is not ſo good, theſe notes doe all agree to our *Turbith officinarum*. Turbith is more uſed to be given in poulther, and that ſeldome alone but mixed with other things, or elſe made into an electuary, then in decoction, and purgeth flegme very notably, and tough clammy humours that fall on the joynts, or on thoſe parts that are more remote: it looſeneth the belly of thoſe excrements that ſticke cloſe thereto, and clenſeth the breſt from thicke flegme: it is very profitably given to thoſe that have a dropſie, the leproſie, or the *French* diſeaſe, as alſo thoſe that are troubled with thoſe diſeaſes that riſe from aduſt humours, the blacke jaundiſe and the like, it helpeth day agues, and in generall all other diſeaſes bred of flegme,

Turbith officinarum. The uſuall Turbith.

CHAP.

CHAP. LIV.

Vnicornu sive Cornu Monocerotis. Vnicornes Horne.

VNicornes Horne likewise is a precious Iewell of high esteeme, and with Princes kept alwayes in their treasury to be used upon occasion for themselves, whose worth poore men could not easily reach or attaine unto. There are divers beasts that beare two hornes both male and female, as the Oxe, others the males onely, as Deere, Sheepe &c. Some beare three hornes, as certaine Oxen in India, as *Solinus* reporteth, and some foure, as divers Rammes in sundry Countries hath beene observed, yet casually, not by kinde, and some againe beare but one, whereof some beare it on their nose, as the Rhinoceros, and some in their forehead, as the Indian wild Asse, with a whole hoofe as other Asses have, whereof *Aristoles* and *Pliny* speake, and *Orix* with a cloven hoofe, related by them also and *Columella*: as also certaine Kine in *Zeila*, a City in *Æthiopia*, and *Camphur*, a certaine beast plentifully breeding in the *Molucca* Islands, that liveth both in the water and on land. Some other creatures also there are that beare but one horne, as certaine Fishes, breeding plentifully in the Indian Seas, whereof *Vlerif* so called (which I take to be the Sea Vnicorne) is one, and the Sword fish, and certaine birds in *Æthiopia* as *Ælianus* maketh mention: but of all these creatures with one horne, none are said or found to have white hornes but the Vnicorne (of the Sea as well as the Land) called by the Hebrewes *Rem* and *Reem* (famoused in the Scriptures) by *Avicen Acherchedeu*, by some other *Arabians Barkaran*, by the Greekes *Monoceros*, and by the Latines *Vnicornus*, for some are said to be black e others red, *Ælianus* describeth the Indian Asse to have his horne to be whitish at the bottome, reddish at the toppe, and blacke in the middle: the received opinion of the Vnicorne is, that it is a beast of the fisse of a meane horse (but I thinke it cannot be possible but he must be much greater, to beare so large so long, and so massie a horne, such as are to be seene in sundry places of *Europe*, (if such be the horne of any beast) for as *Bellonius* saith there are twenty whole hornes, and as many that are not whole but broken, to be seene in severall places in *Europe*, one whereof which is the greatest and most noble, is that which is kept in the Church of Saint *Dennis* by *Paris*, which is seven foote long at the least, so that a tall man can hardly reach the toppe thereof with his hand, it weigheth 13. pound and foure ounces, no man can graspe it wholly in his hand, being five inches in the diameter or thickenesse, and an handbredth, and three inches in the circumference, it is straight like a torch or staffe, but writhed about on the outside, from the right hand to the left smooth, smooth and not bunched out, save at the lower end next unto the head, where it is greatest, and falling still smaller unto the end, of a browniish colour on the outside, but white like Ivory within, without any line in it, and having but a ring about the outside, it is also hollow at the bottome, a foote upwards, whereby it may plainely be discerned that it falleth not off of it owne accord, which maketh it to be of the more account) the beast is said to be of the colour of a Weasell, or somewhat more red (yet some say grayish) having a head like a Hart, the necke and maine not very long, with thinne haires, and falling to one side, with a small beard like a Goate but lesser and shorter, the thighes and legs, not great, the hoofe parted and the taile like a Boare: but none of the auncient Writers, have made mention of any Physicall properties therein, *Ælianus* onely accepted *lib.4. c. 52.* who yet saith the horne is blacke. The property of the Vnicornes horne is cheifly to resist poyson, and the bitings of venemous creatures, it is also given against the plague; and other contagious diseases, to expell melancholly likewise, and to cherish, exhilirate, and strengthen the vitall spirits, and more noble parts. It hath alwayes beene accounted of great worth, and not but for great persons and Princes, for the beast being rare and seldome to be seene or had, being so wilde and fierce that he is not to be made tame (howsoever some have written that they will grow milde at the sight of young Maidens, and be brought to sleepe neere unto them) and the hornes not to be had (in that they doe not cast them as some other beasts doe) but by the death of the beast, that liveth so farre remote from these parts, and in huge vast Wildernesses among other most fierce and wilde beasts, Tigers, and Panthers, &c. and especially because the Indians hunt them not either for their pleasure, or to make any profit by them, the Merchants not seeking after them, the hornes I say, must needes be rare and scarce to be had, and of great worth and price, if they be had, which keepeth them in the more high esteeme. And therefore there want not Impostors, that for lucre sake, doe counterfet it, and worke Ivory, and other hornes artificially into peeces of severall shapes and formes, and obtrude them for Vnicornes horne, to many ignorant persons, but the true and right horne is in part described here before, but to adde further, that the true horne being broken, sheweth to have some thicke fouldes or coates one over another, the inside is white, though the outside is not so white but browniish, and a very smooth graine, without any line veine, or curled waving therein, having onely a circle sometimes about the edge or brimme. Much Vnicornes horne as they say, is to be had with our Druggists and Apothecaries, which is in small long round peeces, some no thicker then ones finger or thumbe at the most, or seldome bigger, that is very white, somewhat heavy and solid, with a smooth graine, which because I cannot thinke so much of the right Land Vnicornes horne is to be had so readily, and so small: I verily beleeve it to be of the Sea Vnicorne, which whether it hath that efficacy that the other is said to have I know not.

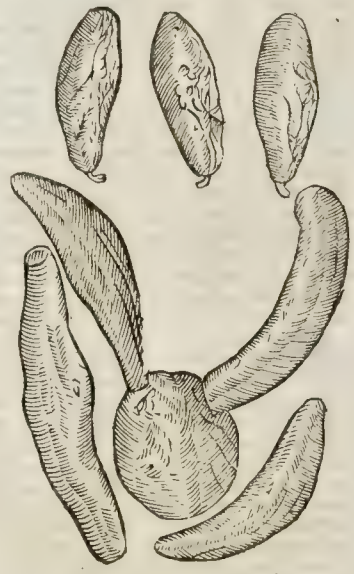
And it is somewhat probable that even all those hornes formerly mentioned both in *France*, *Venice*, or elsewhere, and that also of our Kings, kept at *Windsor*, or the Tower, is but of the Sea Vnicorne, for even such as is before described was brought home by Sir *Dudley Digges*, as I take it found on the shore, and cast up by the Sea in some place towards the North-West, and given to our King *Charles*, who for the tryall caused his Physitions and others to view it and make report thereof to him. And my selfe having seene it, did well perceive it to be writhed on the outside, in the manner before said, and was wonderous white within also, and of a close firme graine: The horne was not fully whole, but broken off a little at the end, and hollow at the bottome.

CHAP. LV.

Zedoaria & Zerumbeth. Setwall.

THe Setwall that we have usually in our shops, doth not alwayes hold one uniforme face and fashion, but divers, for some is thicke and short, others more long and round, some great, others small, some whole, others broken, as it is usuall in all things almost, either forraigne or domesticke, and yet the severall varieties of formes, being of so little difference cannot make them severall things, especially seeing their taste and quality is all one, or but so little differing that any judicious may soone determine the controversie. *Garcias ab Orta* distinguisheth betweene *Zedoaria* and *Zerumbet*, making them to be two divers things and therefore speaketh of them in two severall Chapters, wherein as it seemeth he maketh *Zedoaria* to be the *Geiduar* of *Avicen*, which yet he saith *Avicen* knew not, because it groweth in the *Chineses* Country, and is very rare to be seene or had, but from such vagabond Indians, called *Iogues*, as travaile begging through all those Countries, which *Geiduar* or *Gedwar*, as *Garcias* saith is of the bignesse of an Ackorne, and neere unto the same forme, weighing about halfe an ounce, and of a cleere colour, but *Clusius* giveth us the descri, tion and figure of it a little larger, which as he saith he had from *Pona* of *Verona*, and compareth them to the smaller rootes of *Asphodill*, or the rootes of *Anthora* of an ash-colour on the outside, and yellowish within, and of an hot sharpe taste. *Zedoaria* is called *Zurumbet* by *Serapio*, and saith they are rootes like unto the round *Aristolochia*, but of the colour and taste of Ginger, and brought from *China*: *Avicen* saith that *Zedoaria* is like unto *Aristolochia*, but lesser, and afterwards saith, that it is likely to be *Geiduar* or *Algeiduar*, and giveth unto it the same qualities that *Serapio* doth to his *Zedoaria* or *Zerumbet*: *Rhasis* maketh *Zedoria* and *Zerumbet* all one, and *Mesues* also seemeth to agree unto them, but differeth onely in a degree of heate; so that you may plainely see that all these sorts are made by these Authours to be of little or no difference, and so they seeme unto me, as they have also to others before me, who have as I have done, seene all these diversities of forme come over together unto us: *Lugdunensis* setteth downe very truely the figure of *Zedoaria* and *Zerumbet*, as they grow together, the longer peeces joyning to the round like the *Asphodill* rootes, to one round head. *Garcias ab Orta* saith, that *Zerumbet* (or *Zerumba*, although he maketh them differing as I said, in one Chapter, yet all one in the next) groweth plentifully wild in *Malavar Calecut*, and *Cananor*, and is also planted by divers in sundry places, calling it wild Ginger, those of *Surrat*, *Decan*, and *Canara* call it *Chachoran*, and those of *Malavar Sua*, and hath leaves like unto Ginger but greater, longer, and broader. There have beene some that have thought *Zedoaria* to be some of the kindes of *Costus* that *Dioscorides* describeth, because it agreeth in many things therewith, *Zedoaria* being not specified by him, or the auncient Greeke, and indeed both forme and quality comming so neere may cause it well to be accepted as the substitute thereof. All these sorts as they are made divers by the writers of them are said by them to be effectuall against poysons of all sorts, and venomes of virulent creatures, and we have found them of much use and profit in the pestilence and other contagious diseases, as also to warme a cold stomacke, and to expell winde mervailously, to represse vomitings, to dry up and consume catarrhes and defluxions of rheume, to dissolve the Impostumes of the matrix, and to stay the looseneese of the belly, and is also very powerfull to stay or disperse the unsavoury belchings of those spirits that Garlicke, Onions, &c. or wine have caused.

Zedoriæ longæ & rotundæ genuina effigies itemque & Geidwar Arabum. The true figure of the long and round *Zedoaria*, and of the *Arabians Geidwar*.



CHAP. LVI.

Zingiber. Ginger.

GIngĕr as *Garcias* saith groweth in all the Countries of the East Indies, either planted by the roote or sowne of seed, (the roote saith an *English* rare traveller, spreadeth in the ground, and hath leaves like wild Garlike, which they cut every fortnight, to put into their brothes and meates:) It groweth saith he, with leaves like the water Flagge, or Corne Flagge, and not like the Reed, thus saith he, and so saith *Monardus* also, but *Acosta* saith that it hath leaves very like to the greater sorts of Miller, *Iobs* teares, and with a thicke stalke like Asphodill leaves thereon, close to the stalke, so that it seemeth to be a small Reed, and *Lobel* setteth

Zingiber forte Brasiliense nigra radice.
Brassill Ginger with a blacke roote.

Zingiberis siliqua & semen.
The seed pod, and seed of Ginger.

Zingiber orientale floreſcens.
The figure of the orientall Ginger with the flower.

ſet teth forth the figure of Ginger as it grew he ſaith with *Adrian Meuleneere* in the Prince *Mauritius a Naſſan* his Garden, having ſundry ſtalkes about a foote high, ſhewing like unto a Reed new ſprung up, and condemneth that old figure as falſe, that was formerly accounted the right, which had leaves of the faſhion of an *Iris* or Flowerdeluce, which contrarieties are as ſome may thinke, hardly to be reconciled, yet I will endeavour to make both theſe aſſertions to be true although they ſeeme ſo much to vary, thus: We have two ſorts of Ginger brought unto us, plainely differing in the ſubſtance and colour of the rootes, but not in the forme, ſaving that the one is more ſlender which is the blacker, then the white, for the one is white within and cutteth ſoft, which is the Ginger wholly in uſe for meates and medicines with us, the other is hard and almoſt wooddy, and cutteth blackiſh within, ſo that it is very likely that the one ſort which I take to be the Eaſt Indie ſort, with the ſoft white roote, hath Flagge-like leaves, and hath beene ſeene in flower in *Germany*, as *Emanuel Zwerts* hath ſet out the figure (and I here unto you, and the ſeed veſſell alſo, with the ſeed not much unlike that of an *Iris*) with this title *Zinziber flore albo folio Iridis*. The other roote that is more ſlender and blacke, yet of the ſame faſhion, may be that which beareth Reed-like leaves, as *Lobel* hath ſet it forth, rather to be preſerved then for ordinary uſe with us, and which as I thinke is the *Mechinum* of *Lobel*, or *Zingiber fuſcum*: whereof he giveth the figure of a more excellent ſort, that was joynted like *Doronicum* parts, and therefore accounted by *Pona* to be the true *Doronicum*, as is ſhewed before in this worke, in the Chapter of *Doronicum*, and brought from *Braſſill*: So that the matter being thus reconciled, and each of them ſorted as they ſhould be, let me ſhew you that both ſorts are preſerved while they are freſh and greene, and the blacke ſort as well alſo, after it hath beene dryed, by new ſteeping it, and boyling to make it render, but I cannot finde that the white ſort will ſo well ſerve to be preſerved after it hath beene dryed, but is the beſt being preſerved greene, ſuch as the *China* and *Bengala* Ginger is. The properties of Ginger is to warme a cold ſtomacke, and to helpe diſgeſtion, to diſſolve

dissolve wind both there and in the bowels, while it is fresh it is eaten in sallets with the Indians, the roote being sliced and put among the herbes, and helpeth to mollefie and loosen the belly by the moisture therein, which then abateth much of the heate which being dry it hath, and helpeth to bind the belly. The preserved Ginger is most acceptable and comfortable to the stomacke, and is availeable to all the purposes aforesaid.

CHAP. LVII.

Zibettum. Civet.

CIvet, called *Algalia* by the Indians, and the beast from whence it is taken *Algali* or *Aligali*, is well knowne now adayes to all, to be an excrementitious moisture, or condensate sweate of a certaine beast somewhat like unto a great Cat, and thereon called a Civet Cat, gathered from a peculiar place or purse in that Cat, prepared by nature for that speciall purpose, and is taken forth with small spoones of Ivory or wood, and that by strong hand, the beast being held very close and hard for feare of biting, while they are in taking it forth, for it is very fell and fierce, being moved and angered, and then most when they are about that businesse. I shall not need to describe the beast unto you, which *Clusius* hath done in figure very exactly in his *Curæ Posteriores*, and is so frequent, not onely in our Land, with a great many that keepe them for the profit or use of the Civet, but in divers other Countries in *Europe*. The Civet is used as a perfume or sweete sent generally, either by it selfe or mixed with other sweete things, it is used also to comfort the head and braine, and to helpe the deafenesse and dissinesse in the eares, being put thereinto, wrapped in a little blacke wooll, it is much commended against the suffocations or rising of the mother, to be used in a plaister, or but put on the middle of the plaister and laid on the Navell, or some put into the Navell. I know none that ever used it inwardly, but in outward remedies: it is said that women are much delighted therewith, and helping sundry of their defects.

Having thus shewed you here most of the chiefest Drugges in our Apothecaries shops, that come to us from forraigne parts, that are not formerly expressed in this Worke in severall places: Let me now lastly to close up this whole Worke, shew you other strange and rare Plants, both Herbes and Trees, with their Gummes, Seeds, Rootes, and Fruites, &c. growing in the East and West Indies, and those parts neere unto them, as they have beene observed by those that in their travells saw them, and brought many of them into *Europe*, that wee may contemplate the wonderfull Workes of God, that hath stored those Countries with such differing Herbes and Trees from ours, and yet it is very certaine that there is much more unknowne then is already made knowne unto us. I will first beginne with Herbes, and the parts thereof, as seedes and rootes, whether medicinable or admirable, and then with the Trees and their fruites that are pleasant to eate; and lastly with those which for the most part have some medicinall use.

CHAP. LVIII.

Payco herba. Indian Plantaine for the stone.

HEre growethin *Peru* in the West Indies, an Herbe whose leaves are like unto our Plantaine, which being dryed are very thinne, and taste hot and extreame bitter. The pouther of them taken in Wine, helpeth the chollicke and the stone, whether proceeding of wind, or of any cold cause, the leaves boyled and applyed warme to the pained part, worketh the same effect.

Herba alrenum morbis utilis. Lactucæ similis.

Another Herbe likewise was sent from thence like unto Lettice new sprung up, and of the same colour, being without taste and very profitable for the stone in the kidneyes, comming from heate, the juyce being applyed to the place mixed with some ointment of Roses, and the leaves also laid thereto: the juyce thereof likewise cooleth inflammations, Saint *Anthonyes* fire and the like hot eruptions in the skinne, and easeth the paines.

Cachos semen.

From *Peru* likewise saith *Monardus* came the seed of a bushy plant, there called *Cachos*, being very small and taken from the fruite thereof, which was like unto the *Mala insana*, Madde Appels, flat on the one part, and round on the other, of an ash colour on the outside, and of an excellent greene colour but thinne, and of a round forme. It is of much esteeme with the Natives, for the especiall vertues thereof, in provoking urine, and expelling gravell and the stone, yea and breaking the stone in the bladder, if it be not growne hard by long continuance, dissolving it into sand, and casting it forth with the urine, the seed in pouther being taken in some water convenient for the purpose, whereof they have had very many and notable experiences, which sand after it is expelled will grow hard as into stones againe.

CHAP. LXIX.

Coca. The herbe Coca.

THe seed of this Coca is sownë with great care by the West Indians in beds, by rowes, and riseth to be a plant of three or foure foote high, with a stalke as bigge as a good wand, and somewhat greater leaves then the Myrtle, having as it were another leafe in the middle thereof, being soft, and of a pale greene colour: the berries are red before they be ripe, but blackish afterwards, growing clustring together, and then they gather the leaves, laying them to dry, that they may be kept all the yeare and

and carryed to and fro into severall Countries, for thereof is the Natives chiefe Merchandise to provide them of all necessaries for life, being instead of money, which is generally used by the *Americanes* to be chawed, as well in their long journeyes to preserve them from hunger and thirst abroad, as for pleasure at home, which they use after this manner: they burne Oyster shells, and with the powther of them they mixe the pouther of the leaves of this *Coca* first chewed in their mouthes, and so made up as it were into a paste or dough (but take lesse of the pouther of the Oyster shells then of the leaves) whereof they make small pellets *trochisses* or *trossis*, laying them to dry, and so use them one by one, holding them in their mouthes, rolling them to and fro, and sucking them untill they be quite spent, and then take another, which maketh them able to travaile many dayes with strength, without either meate or drinke, through uninhabited places, where none is to be had: If they stay at home, they use the *Coca* alone, chewing them sometimes a whole day without ceasing, untill the substance be sucked forth, and then use another: if they would have them to be stronger, able to intoxicate their braines like unto drunkennesse, or to be as it were senslesse, they put the leaves of Tobacco to it and take great pleasure in those courses.

CHAP. LX.

Betre, Betle, Betele, sive Bethle. The Indian Bindweed called *Betle* or *Betre*.

THe East Indians doe use the leaves of this *Betle*, much after the same manner that they of the West doe the last recited *Coca*, and therefore I thought good to joyne them together. It groweth very like unto a Bindweede, wrapping and winding it selfe about the trees, up to the toppes almost, or other things that it is planted against to uphold it, or lye on the ground and rot, and therefore they for the most part, plant it against the tree *Fausel* or *Areca*, or such other like tall and great trees, in the same manner as they doe Pepper, whereunto it is so like that a farre off those that are not well exercised in the knowledge of them, may soone mistake one for another (and therefore *Gerard* called it Bastard Pepper, when as it is neither in fruite, taste, or use like unto Pepper) having onely leaves somewhat like to Pepper, but more like unto Bindeweed, yet thicker, of a yellowish greene colour, with three great thicke ribbes therein (which the Indians with the nailes of their hands, kept long and pointed for this purpose and not round like ours, doe nippe or pare away before they dry them, whose taste is somewhat aromaticall but bitter; the fruite is slender, and about two inches long, writhed or consisting of five cods writhed one about another like unto a cord or rope, of a yellowish colour, tasting peerty spicy or aromaticall, the plant is much tended and often watered to cause it grow the better, and because it delighteth not in any very hot or cold Country, and seldome groweth in the upland Countries, but continually neere the Sea side, or not farre distant from it. Physically this is used to strengthen the head and stomacke, after the cleansing of them from rheume and flegme, to comfort the heart, and to breake or discusse winde in the stomacke or bowels: it fastneth loose teeth, and maketh them yellow, causing also a sweet breath, yet their breath stincketh fowlest that using daily to take it, doe forbeare for a while from it: but generally throughout all the East Indies, the leaves are used both of the Princes and people, the greater persons make certaine compositions for themselves, with the leaves hereof, Camfire of *Burneo*, *Lignum* Aloes, Muske, and Ambergriese, others put Cardamomes, and Cloves to them, but the ordinary manner of preparing them is, that after the ribs be taken away with their nayles, they chew those leaves in their mouthes, and spit out the first juyce that commeth from them, which is like blood, and put unto them a little of the *calx* of burnt Oystershells, and the fruite of *Areca* or *Fausell* beaten small which give them a pleasant taste, and is generally eaten by them all, and none of the meaner sort or others that have not presently before eaten thereof, will in civility speake with any great person, but they will hold their mouthes that their breath doe not offend them. It is called *Betre* in *Malavar* and *Pam*, in *Decan* and *Guzarate* but in *Malayo Siri*, *Garcias* saith that he as well as others tooke these leaves to be the *Folium Indum*, or *Malabathum* of the Greeke Authours; but was deceived therein,

Betre sive Betle.
The Indian Bindeweed called *Betle* or *Betre*.

Chap. LXI.

Gnacatane. Indian Pilewort.

THis ſmall herbe as *Monardus* ſaith was ſent out of that part of *America* or the *Hiſpania nova* being white like unto *Folium montanum* but without any ſweet ſent, and is much commended to helpe the ſwelling and falling downe of the Piles or hemorrhodiall veines if the herbe be boyled in wine ſo as there be no heate, or elſe in water and the grieved place fomented with the warme decoction for a while then gently wiped and the pouther of the herbe caſt thereon being bound thereunto: it alſo eaſeth aches and paines in any part of the body if the grieved place be firſt annointed with molten Roſſin not too hot, and the pouther of the herbe ſtrewed thereon (which is an homely manner of dreſſing) and cloathes layd preſently upon it which will ſticke ſo faſt as that untill it hath wrought the effect it will not be plucked from the skinne and fleſh: the pouther of this herbe caſt upon any ſmall wound or ſore, eſpecially thoſe in the groine, doth clenſe them and heale them afterwards.

West Indies that is called *Gnacatane. Indian* Pilewort

Chap. LXII.

Herba Indica ad rupturas utilis. Indian Rupture-wort.

ANother ſmall herbe was likewiſe ſent from thoſe parts, whoſe forme could not be diſcerned by reaſon of the ill carriage and breaking thereof being dry: but highly commended to helpe Ruptures or burſtings in young or old: the herbe being freſh bruiſed and applied to the place whereunto a truſſe afterwards was bound that had no ſhoulders, yet ſate as cloſe as thoſe that had, and this *Ligatura* the *Indians* uſe, which kind of truſſe ſaith *Monardus* lying ſo firme and cloſe as he reported that was cured thereby, is ſufficient of it ſelfe to helpe any Rupture without any other medecine, and as he ſaith he ſaw a leech of *Corduba* that helped all burſtings with ſuch unſhouldred truſſes or bindings onely, and many hee knew then living that were ſo cured.

Planta Indica ſanguinalis Panacea, id eſt, ſanguineos ſudores excitans.
The Indian Allheale, blood ſweating plant.

A Certaine Indian Leech as it is recorded in *Petrum de Oſma* his letter to *Monardus* did uſually in the City *Paſto* cure all manner of diſeaſes onely with the juice of a certaine herbe annointing the Arteries and the grieved place therewith, and afterwards laying them to ſweate in their beds being well covered, whoſe ſweat was well neere as blood, & in this manner he proceeded untill he ſaw they had ſweat ſufficiently, cauſing them to uſe in the meane time an excellent fine diet of wholeſome meats: ſundry deſperate diſeaſes were cured by him, yea they ſeemed more young and luſtie that uſed this order then they were before; but no intreatie or promiſe of reward, nor all the meanes that could be uſed to him, would make him reveale this ſecret to any, or tell what herbe it was whoſe juice he uſed.

Chap. LXIIII.

Herba vitam ante mortem in morbis prænuntians. The Indian Fortune teller of life and death.

A Certaine Indian of chiefe account comming into the count *de Nieva* his houſe that was in *Peru* upon ſome occaſion of buſineſſe, ſaw a woman ſervant of the houſe very ſad and ſorrowfull, for that her husband lay then very ſicke of a grievous diſeaſe, he asked her if ſhee would faine know whether her husband ſhould thereof live or dye, ſhe ſaying yea, he ſent her a branch of an herbe which he willed to be put into his left hand, and there to hold it faſt, which would make him ſeeme pleaſant and merry if he were to live, but ſad and ſorrowfull if he ſhould dye, which ſhe ſo uſing it and finding her husband ſodainly to become ſicke that ſhe thought he would preſently have departed this world, ſhe pulled the herbe out of his hand and threw it away, but within a ſhort time after this her husband dyed: but *Monardus* ſaith he doubting of the truth thereof enquired of divers and it was affirmed unto him by a noble man that had long lived in *Peru* that it was true, and that it is uſuall with the Indians to doe ſo in diſeaſes, which is a matter of great admiration and wonder.

CHAP. LXV.

1. *Herba Viva.* The Herbe of life or love.

THere are two sorts of this kinde of plant that are to be distinguished in sunder, and not to be accounted all one as divers have thought that are knowne to us of late (and yet I thinke verily there be some others of the same nature, not sufficiently yet made knowne to us, which I gather out of the writings and relations of divers. The one is an herbie plant without any prickes or thornes thereon, for any thing that I can learne thereof, and is this I am now about to shew you: The other is both a shrubbe, or as some say a tree, and thorny also which shall follow. *Garcias ab Orta* first maketh mention thereof to grow in divers places of the East Indies but giveth it no name. *Acosta* saith it is called by the Christians there generally *Herba viva*, and of the Indians *Herba amoris*, of the Arabians and Turkes *Sulac* and *Sulnque*: The leaves are compared by them unto the leaves of *Pollipody*, but *Acosta* rather compareth them to the leaves of *Orobus*, foure or five, or divers rising from the roote, each upon its foote stalke, being winged with many smaller ones then those of *Orobus*, set on both sides of the stalkes, which are about two inches long a peece, of a pleasant greene colour very beautiful; among which leaves rise up divers slender bare naked stalkes, each of them bearing one flower at the toppe in forme somewhat like unto a Pinke, but of a yellow colour without any sent at all. The admirable propertie hereof is, that if any shall touch it with their hand, and some say that if any man doe but breath upon it, it will presently draw it selfe together, and if one would take it into their hand it will close together as if it were dead. But that which is more admirable is, that if they shall withdraw their hand it will quickly after as it were revive againe and spread it selfe as it was before it was touched, and this it will doe many times in a day if it be touched and let alone againe without touching. Other properties it is fayd to have, as to restore Virgins that have beene defloured, if ye will beleeve it, to procure love betweene man and woman, and as *Acosta* saith he was informed by an Indian Phisition of good credit, that he would cause any woman to be at his will and pleasure, so that he would but declare her name, and use it (or rather abuse it) as he would appoint him, but the fact being unlawfull, he refused the condition.

2. *Frutex sensibilis Herba Mimosa dicta.* The Mimicke herbe called the sensitive thorny shrubbe.

This other Mimick, Mocking or Sensitive plant groweth to be a wooddy Shrubbe, yea some say to be a tree, having divers sprigs rising from the root, and branching forth sundry leaves set here and there, with short thornes or prickles, leaning as *Acosta* unto other trees or walls, but *Clusius* saith it spreadeth on the ground taking roote at the joynts, and sundry wings of fresh greene leaves thereon, which upon the touch of any man, or his breathing onely, and not of any thing else would shrinke and seeme as withered; but neither flower nor fruit hath *Acosta* mentioned, but I am enformed from Mounsieur *Iohn de Laet*, out of a Spanish relation thereof in a booke printed at *Mexico*, that it beareth flowers and fruit somewhat like unto the Chesnut, many of them hanging downe together in a cluster, being greene at the first and afterwards red, these be others relations: but let mee shew you what I have seene of the living plant as it grew in a pot at *Chelsey* in Sir *John Davers* Garden, where divers seeds being sowne therein about the middle of *May*, 1638. and 1639. some of them sprang up to be neare halfe a foot high, yet others were inferiour, the tallest shot two or three stalkes from the root, somewhat hard and wooddy, with divers joynts on each side, and severall branches thereat, as also a small short thorne at each

1. *Herba Viva.* The herbe of Life or Love.

2. *Frutex sensibilis Herba Mimosa dicta.* The thorny sensitive Shrub or Plant.

joynt, which branches had severall paires of winged leaves set opposite each unto other, containing some eight some ten small leaves on a side without any odde one at the end, set very close together, being narrow, smooth, and of a full but fresh greene colour, not fully round pointed nor dented, foulding themselves upward close to the middle ribbe, upon any touch thereof, this in the elder growne plant, but in that which was young the whole stalke with leaves would fall downe and shrinke up the leaves: this I proved in those two severall yeares before recited: the former yeares plants as they grew in the pot, I caused a cunning hand to draw to the life, which I here exhibite unto you with the other, that you may see the difference betweene it and others formerly set forth from the sight of a dryed plant. If this could have beene preserved in our Winters, our Sommers would have declared a more ample and full demonstration thereof. This is said to be not so quicke in apprehension as the former. It is said also that the stalkes have the smell and tast of *Licoris*, and are used by the natives usually to helpe the cough, shortnesse of breath, hoarsenesse of the throat and voice, to cause flegme easily to be expectorate, as also to ease the paines of the stone in the Kidneyes, and healeth up fresh wounds. That Spanish Author before recited relateth also that it procureth sleepe being applyed to the head, but sooner with the *Americanes* then the *Spaniards*: said also by them to procure love, but could not shew how or by what way; it helpeth the Flux or Laske of the belly by that astringent and glutinous qualitie therein perceived by the taste; as also *tertian* Agues, and the inflammations and rednesse of the eyes. The said author saith that he understood, yet hee knew not how truely that in the *Philippinas* they have such another plant yet differing in some particulars, for it is said theirs shooteth forth ten or a dozen straight twigs from a root, each of the bignesse of an Hens quill, one whereof had a dozen leaves on them in foure rowes set at distances, six inches betweene, being like unto Reddish leaves: the flowers were blew like unto a birds tongue before they were open, and divided it selfe afterwards into three leaves. This upon touch or breathing thereon would not fall downe as in the former and rise againe, but said to fall away, that is, the lower leaves and so likewise the upper leaves if they were touched againe, but the stalke also would breake off and fall downe upon the touch or breathing, and if they should be broken by any ones hand, the place would seeme as black as if it were burne: but that it would not doe so if it were toucht with a sticke or wand. The *Herba Mimosa* seemeth likely to be the *Æschinomenes* of *Apollidorus*, whereof *Pliny, lib. 24. c. 17.* maketh mention. As also that tree that *Theophrastus* saith, *lib. 4. cap. 3.* grew about *Memphis* in *Egypt* which differed not from other trees, either in forme leaves or branches, but in the event for the outward face thereof was thorny, and thē leaves like Ferne (as *Gaza* transtateth it) but *Pliny* much better, like feathers, which being touched shranke as withered and dry, and by and by after revived againe. The Earle of *Cumberland* in Queene *Elizabeths* dayes brought from the sacke of *Portricco* some of these plants, but lived not long in the ayre of *England*; some of the dried and dead ones being afterwards sent to *Clusius* by *Iaques Garret*, whose figure is that he exhibited in his *Christophorus Acosta*.

CHAP. LXVI.

Stirpsnimans seu Frutex impatiens. The shrinking shrubbe.

SOmewhat like unto those before remembred is this shrubbe, which our English which went with Sir *Iames Lancaster* found by chance travailing neare the Sea shore, on the East side of the Ile of *Nicubar*, as also on *Sombrero*, an Iland which is neare *Nicubar* & *Sumatra*, the younger sized, being like small bushes, halfe a yard or two foote high, at the toppes of whom grew foure or five branches full of leaves somewhat round like unto Mirtle leaves, as greene as Sorrell and full of sap or juice; which bushes being strucke by ones foot or otherwise as they passed by, were observed to shrink downe as low as the branches would let them, and rise againe by and by after to the former height; the reason hereof was, that every plant grew out of the mouth or belly of a long living worme within the earth, which drew downe the plant being strucken; but in the elder or greater growne plants the worme was consumed, and the rootes of these bushes being plucked up after they had remained a day two or three above the ground, became as hard as Corall: the rest of the bushes remayning as wooddy as other shrubbes. This threefold change or alteration in nature, first from a living worme to a vigetative plant, and then to a stony substance, maketh it more admirable above any.

CHAP. LXVII.

Planta animal seu Borametz Agnus Scythicus. The *Scythian* Lambe.

THis strange living plant as it is reported by divers good authors, is called by the Natives *Borametz quasi agnellus*, by others either *Planta Ruthenica agno similis*, or *Agnus Scythicus*, or by some *Planta animal*; it groweth among the *Tartares* about *Samarcanda* and the parts thereabouts, rising from a seede somewhat bigger and rounder then a Melon seede, with a stalke about five palmes high, without any leafe thereon, but onely bearing a certaine fruit on the toppe, in forme resembling a small lambe, whose coate or rinde is woolly like unto a Lambes skinne, the pulpe or meate underneath which is like the flesh of a Crevise or Lobster, having as it is sayd blood also in it; it hath the forme of an head, hanging downe, and feeding on the grasse round about it, untill it hath consumed it and then dyeth, or else will perish if the grasse round about it bee cut away of purpose: it hath foure legges also hanging downe: the Wolves much affect to feede on them.

CHAP.

CHAP. LXVIII.

Manobi forte Braſilianorum. Indian earth nuts, or Peaſe.

THere is growing in ſundry places in *Braſſil* and in *America* alſo, neare the River *Maranon* a certaine fruit or Peaſe breeding under the ground like as puffes doe, without either leafe or roote as it is ſayd, but they are no bigger then great Peaſe, and incloſed in a ſmall grayiſh thicke and ſhort cod, very like a ſmall Peſcod, with one or two Peaſe therein, of a pale reddiſh colour, on the outſide and white within, taſting like unto an Almond, which will rattle being ſhaked in the skinne, growing many together and tyed by ſmall ſtrings. The fruits are eaten as junkets with great delight, for their pleaſant taſtes take eyther freſh or dryed, but a little toſted make them relliſh much better, and are ſerved to the table of the better ſort as an after courſe, and doe dry and ſtrengthen the ſtomacke very much, but taken too liberally breed head ach and heavineſſe.

CHAP. LXIX.

Radix Sanctæ Helenæ. Saint *Helens* beads, or Indian round ſweet Cyperus.

NEare the Port of Saint *Hellen* which is in *Florida*, grew certaine rootes very long and full of knots, of round joynts as great as ones thumbe, blacke without and white within, taſting ſomewhat aromaticall like *Galanga*, which when they are dry are as hard as an hornē, the leaves are large and very greene, growing on ſtalkes that ſpread on the ground: it groweth in moiſt grounds, and is drying in the beginning of the ſecond degree, and heating in the end of the ſame, the pouther of them taken in wine is uſed againſt the paines of the ſtomacke and bowels, eaſing the collicke and ſtone in the Kidneyes, and provoking urine. The Indians uſe to ſprinkle the pouther of the rootes all over their bodies, being ready to goe into the Baths, becauſe as they ſay, it bindeth the skinne and ſtrengtheneth the members of the body by its ſweet ſent. They uſe therē to disjoynt theſe round knots of the rootes, which being drilled and ſtrung ſerve them in ſtead of Beads to tell God how many prayers they will give him at a time. *Cluſius* thinketh theſe roots may not unfitly bee referred to ſome kind of *Cyperus*, but I thinke the large leaves contradict it.

Radix Sanctæ Helenæ.
Saint *Helens* Beads, or Indian round ſweet Cyperus.

CHAP. LXX.

Radix Quimbaya. *Carthagenas* purging roots.

PEtrus Cieca maketh mention of theſe roots in the firſt part of his *Peruvian* hiſtory that they arē ſlender, of about a fingers thickneſſe, growing among the trees in *Quimbaya*, a Province in *Peru* whoſe cheife city is *Carthage*: if ſome of theſe roots be taken and ſteeped in a good quantitie of water all night, they will drinke up moſt of the water, but yet three ounces thereof remaining being drunke doe purge the body ſo gently and without trouble or perturbation, as if it had beene purged with Rubarbe, this hath beene often tryed. *Cluſius* thinketh that theſe rootes were the ſame or very like unto ſuch as was ſent him by a friend by the name of *Bexugo vel Peru*, which he tooke to be no other then the branches of *Atragene* or *Viorna* of that Countrey, they were ſo like.

CHAP. LXXI.

Rhabarbarum Americanum. Rubarbe of *America* or Weſt Indie Rubarbe.

MOnardus ſaith, that among other things werē ſent him out of the maine of thē Weſt Indies he had a peece of a roote which they called there by the name of Rubarbe, and was very like the Eaſt Indian kind, for as hee ſaith it was round, with a browniſh coate and reddiſh core or inſide, which being broken, had ſome whiteneſſe mixed among it, and coloured the ſpittle yellow like Saffron, being bitter withall, but what leaves it bore was not ſignified. This is not the white Rubarbe of *America*, for that as is ſayd in its place is the *Mechoacan*.

CHAP. LXXII.

Carlo Sancto. The Indian Hoppe-like purger.

OVt of the Province of *Mexico* commeth this root which they there call *Carlo Sancto*, for what cauſe is not well knowne, it groweth after the manner of Hoppes, climing on poles or other high things, or elſe it will lye on the ground: the leaves are like unto Hoppe leaves, of a very ſad greene colour, and of a ſtrong heady ſent: it is not knowne whether it beare eyther flower or fruite: the roote is great at the head, having ſundry ſmaller ſprayes iſſuing from it, each of the bigneſſe of ones greater finger and white, the barke or rinde whereof is eaſily ſeperated from the reſt, and is of moſt uſe, ſmelling ſomewhat ſweet, and taſting bitter and ſomewhat ſharpe withall: the pith of the roote conſiſteth as it were of many ſmall and very thinne filmes which may eaſily be ſepearated one from another: it is hot and dry in the beginning of the ſecond degree. The barke of the roote being a little chewed in the mouth draweth downe from the head much flegme, whereby rheumes catarrhes and deſtillations therefrom are voyded, and the parts much eaſed of paines and other griefes, in ſome alſo it cauſeth a vomit, avoyding thereby much choller and flegme from the ſtomacke, that oppreſſed it before and ſtrengthned it afterwards, the decoction thereof worketh better thereon; if a purgation fitting the perſon be taken before this evacuation upwards, it will doe the more good: the barke being chewed helpeth looſe gummes, putrid and rugged teeth, and maketh a ſweete breath, but it were good to waſh the mouth with a little wine afterwards to take away the bitterneſſe: the pouther thereof taken in a little white wine, or the decoction thereof with Maiden haire and a little Cinamon eaſeth women of the obſtructions of the mother, the ſtaying of their courſes, and conſumeth winde in their bodies being formerly purged and prepared, and uſing *Liquidambar & Ung Dealthea* of equall parts mixed together, to annoint the lower parts of the belly all the while: the ſame alſo helpeth the Simptomes of the heart, as ſwounings and other the paſſions thereof, eſpecially riſing from the defects of the mother. This decoction likewiſe is very beneficiall for them that are ſo troubled, that is to take two drams of the barke, and boile it in three pints of faire water, putting in at the end thereof foure drammes of the barke of Pomcitrons and two drammes of Cinamon, which afterwards being ſtrained, ſix ounces of this decoction is to be taken with a little Sugar every morning, the body being purged before hand. This pouther and decoction is commended likewiſe againſt the French diſeaſe, the Epilepſie or falling ſickneſſe in the younger ſort: the pouther thereof hath beene often found to cauſe women to have a ſpeedy delivery, and to take away the paſſion and faintings in their tedious travailes, being taken either in wine or in ſome Orenge flower water, the continuall uſe thereof hath beene tryed to amend a cold and weake ſtomake, and to helpe ſuch as could digeſt no meate: the like uſe hath given remedy and perfect cure to thoſe that have beene burſten, ſo that they have not uſed any Truſſe to themſelves being perfectly helped thereby.

Carlo Sancto. The Indian Hoppe-like purger.

CHAP. LXXIII.

Fabæ ſive Phaſeoli purgantes, Purging Beanes.

MOnardus ſpeaketh of certaine purging Beanes that grow about *Cartagena* and *Nombre de Dios* very like unto our ordinary Beanes but leſſer, with a thinne outer skinne, dividing it in the middle which was to be caſt away, leaſt it might procure too violent evacuation both upward and downeward, even to the hazard of life. With the Indians this is a famous and familiar medecine, purging without trouble flegme, and choller, and groſſe humors, and that very gently, the quantity to be taken is from foure of them or more according to every ones abilitie, but you muſt regard that every one of them bee roſted well before they be uſed, but *Cluſius* ſaith he could never ſee ſuch beanes as are here deſcribed, but hath had a certaine kind of *Phaſeoli* Kidney beanes ſent him under the name of *Fabæ purgatrices*, whoſe figure is here exhibited, being round and flat on both ſides, about a fingers thickneſſe and two in breadth or more, yet a little hollow on that ſide where it grew to the huske: the outer huske is hard, and in a manner woody, ſmooth, and of a darke red colour, being white, and of a firme ſubſtance within parting

Fabæ ſive Phaſeoli purgantes. Purging Beanes.

in

into two as moſt other pulſes do, of the like taſte alſo at the firſt, but quickly hot and ſharpe upon the tongue, from whence commeth as it is likly the purging quality: becauſe in ſome ſort theſe reſemble the forme of a heart, therefore ſome called them *Cor Divi Thomæ*, Saint *Thomas* hearts, and beſides becauſe they grow in Saint *Thomas* Iſland. *Cluſius* thinketh that this is the Beane of the *Phaſiolus Braſilianus*, whoſe pods I have ſhewed you in page 1057.

Monardus alſo ſpeaketh of purging nuts, which he calleth *Avellanæ purgatrices*, which grew in *Santo Domingo* that were very like unto Haſell nuts, but three ſquare and browne on the outſide, with a tough thin ſhell the kernell being white and ſweete withall, whereby many were deceived: for they purge very violently both upwards and downewards choller and flegme, even almoſt to the danger of life, which by roaſting of them before the taking is avoyded: they helpe the Chollicke, and expell winde, and are often put into gliſters for that purpoſe; but I have knowne a gliſter given in this manner to good purpoſe: a gliſter being ready to be given with a bladder, the ſmall end of a Tobacco pipe was put into the bladder and tyed (but ſo that it might bee drawne cloſer after the pipe is pulled out) that had Tobacco in the Bole, which onely blowing the ſmoake thereof into the bladder and ſo given hath given preſent eaſe. *Avellanæ purgatrices*

CHAP. LXXIIII.

Faalim Theveti. Mombazas Antidote or Counterpoyſon.

ANdræas *Thevet* mentioneth this herbe in his *Coſmography* to grow in the Iſland of *Mombaza*, having many long leaves like unto *Elecampane*, which Iſland as it aboundeth with many ſingular good herbes, both for meate and medecine, ſo it doth alſo with venomous Serpents: for whoſe remedy it is alſo eſpecially provided of other powerfull herbes, among whom this one is accounted a principall: the experience whereof ſaith hee I have ſeene upon divers people bitten by a moſt virulent Serpent, there called *Alefah*, partly living in the waters and partly upon land, whoſe venome was preſent death, if the patient were not ſuddenly ſuccored herewith.

Faalim Theveti. Mombazas Antidote or Counterpoyſon.

CHAP. LXXV.

Herba Malucana. The poorē mans Chirurgery.

THis herbē riſeth uſually to be two or three cubits high, but in more fertile placēs to bē above five cubits, of a freſh greene colour, the ſtalke is ſlender weake and hollow, leaning unto ſomething to uphold it, or elſe it will lye on the ground, where it will take roote againē, it ſpreadeth into ſundry branches, having tender ſoft leaves thereon like in forme and bigneſſe unto Elder leaves, but dented about the edges, the flowers are like Camomill but all yellow and greater; it is greene all the yeare through; thoſe of *Canaria* call it *Brungara aradua*, and the vulgar ſort, Poore mens remedy and Chirurgions baine, becauſe the common people of India doe generally plant it being naturally of *Maluca*, and uſe it for all hurts, eyther alone or mixed with other things that ſerve fof the purpoſe: the manner whereof is thus, They boyle the bruiſed leaves in oyle, which after it is well boyled and ſtrained they make an ointment thereof with a little yellow Wax; and herewith they dreſſe their ſores, be they old or young, blooddy, putrid, malignant or fiſtulous, and eſpecially is good in the foule ſores of the legges, Another way they have to uſe it by taking the middle or inner rinde, the outermoſt being taken away, which is as eaſily done as in Hempe, and annointing

it with the oyle of the Indian Nut, they rowle it in the leaves thereof, and roſt it under the hot embers, which being growne ſoft, they beate it and then apply it to all ſuch wounds and ſores aforeſaid, which are perfectly cured within a few dayes, without inflammations or Impoſtumes, to the wonder of all that knew it not before: it likewiſe eaſeth all paines, and ſtayeth all fluxes of blood, and is a ſingular helpe to the joynts that are pricked or wounded, and briefly ſerveth the people that uſe no other remedy to helpe themſelves in any caſe of neceſſity, without the uſe of a Chirurgion, and truſt thereto as unto an undoubted remedy; the ointment is carryed into ſundry other Countryes alſo. Another herbe called *Centella* groweth in the Weſt Indies, mentioned by *Monardus* out of *Petrus de Oſma* his Letter to him, who without any deſcription thereof, ſaith that the Indians doe familiarly uſe it, and the *Spaniards* from them, being bruiſed and laid to any tumour in the legges or thighes, comming from a cold cauſe, would cure them by raiſing bliſters that the humours might be let out, and the ſwelling aſſwaged. Another herbe alſo *Monardus* there remembreth from him likewiſe, that would ſtanch the blood of any wound ſuddenly, ſeene, and tryed by certaine captive Indians, that through hunger cut off the calves of their owne legges and did eate them, and preſently applyed the leaves to them, which ſtanched the blood to the great admiration of all that ſaw it. The ſame *de Oſma* ſaith there, he uſed a kinde of herbe growing like graſſe, which of himſelfe tooke the name, which being chewed would draw downe much flegme, and therefore good for rheumes in the head, and defluxions into the throate, and to make lotions to helpe thoſe diſeaſes thereof.

Centella.

Herbe folia ſanguineo ſuco ſilens.

Gramen quod ad pituitam.

CHAP. LXXVI.

Herba Ioannis Infantis. *Iohn* the Infants herbe.

THis is a ſmall herbe growing in the Weſt Indies having leaves like unto Sorrell, but ſomewhat rough and hairy, and tooke the name from one *Iuan Infanta* an Indian, the ſonne of a *Spaniard*, who uſed it to cure wounds, and to ſtanch their bleedings, helping all hurts, prickes, and wounds in the ſinewes, or in any other part of the body, digeſting, cleanſing, and healing them by laying ſome of the greene herbe bruiſed thereunto: or elſe the pouther of the dryed herbe ſtrowed thereon, which is thought to be better then the greene herbe.

CHAP. LXXVII.

Lactuca ſylveſtris pumila. A Lettice for the tooth ache.

ANother herbe was ſent unto *Monardus* out of *Peru*, that was like unto Lettice leaves, but of a darke greene colour, and very bitter in taſte, the decoction whereof kept a good while in the mouth, on that ſide that the tooth doth ake, will eaſe and take away the paine: the juyce of the greene leaves put into an hollow tooth will doe the ſame.

CHAP. LXXVIII.

Mungo. Indian Coriander like ſeed for an Ague.

THe Indians of the Eaſt have a ſmall round ſeed very like unto Coriander ſeed, which is greene before, but blacke when it is ripe, being fodder given to horſes, and men doe alſo eate of them: they of *Guzarate* and *Decan*, uſe the decoction thereof againſt agues, and giving, the ſeed alſo being huſked, and boyled like Rice, unto their aguiſh patients cauſing them to abſtaine from either meate, of bread of Wheate, for many dayes together: It is held that *Avicen* mentioneth this in the 481. Chapter of his ſecond Booke, by the name of *Meſſe*, *Bellunenſis* his interpreter hath it *Mens*, but *Garcias* ſaith it ſhould be *Mex*, and ſo in another place he nameth it.

Mungo ſimilis ſiuſſus. Indian Coriander like ſeed

There hath beene ſent alſo another ſmall creſted graine or ſeed, of the bigneſſe of Pepper cornes, ſo like unto Coriander ſeed, that at the firſt ſight, one might be ſoone miſtaken, but that it is greater and blacke, this might be thought to be the former *Mungo*, but that this is hot, and the *Mungo* is cold, as it is thought fit for ſuch patients.

Mungo ſimilis.

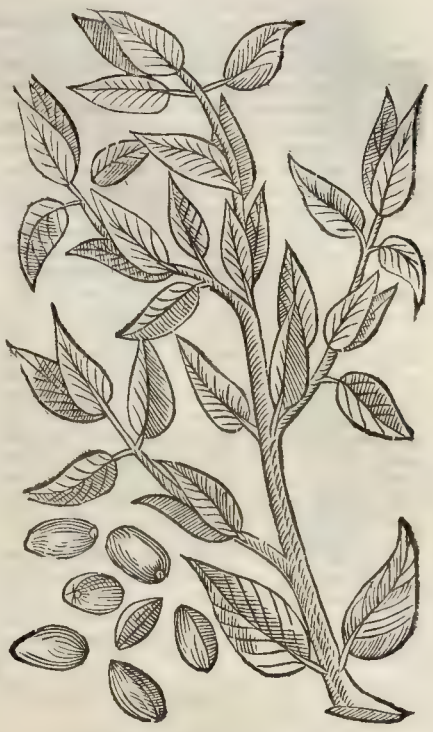
CHAP. LXXIX.

Arbor Ben cum fructu ſuo Buna. The Turkes berry drinke.

ALpinus in his Booke of *Egiptian* plants, giveth us the deſcription of this tree, which as hee ſaith, hee ſaw in the garden of a certaine Captaine of the *Ianiſſaries*, which was brought out of *Arabia felix*, and there planted as a rarity, never ſeene growing in thoſe places before. The tree ſaith *Alpinus*, is ſomewhat like unto the *Euonymus* Pricketimber tree, whoſe leaves were thicker, harder, and greener, and alwayes abiding greene on the tree; the fruite is called *Buna*, and is ſomewhat bigger then

then an Hazell Nut and longer, round alſo, and pointed at the one end, furrowed alſo on both ſides, yet on one ſide more conſpicuous then the other, that it might be parted into two, in each ſide whereof lyeth a ſmall long white kernell, flat on that ſide they joyne together, covered with a yellowiſh skinne, of an acide taſte, and ſomewhat bitter withall and contained in a thinne ſhell, of a darkiſh aſh-colour: with theſe berries generally in *Arabia* and *Egipt*, and in other places of the *Turkes* Dominions, they make a decoction or drinke, which is in the ſtead of Wine to them, and generally ſold in all their tappe houſes, called by the name of *Caova*; *Paludanus* ſaith *Choava*, and *Rauwolfius Chaube*. This drinke hath many good Phyſicall properties therein: for it ſtrengtheneth a weake ſtomacke, helping digeſtion, and the tumours and obſtructions of the liver and ſpleene, being drunke faſting for ſome time together. The *Egiptian*, and *Arabian* women uſe it familiarly while their courſes hold, to cauſe them to paſſe away with the more eaſe, as alſo to cauſe thoſe to flow that are ſtayed, their bodies being prepared and purged aforehand.

Arbor Bon cum fructu, ius Bunc.
Turkes berry drinke.



CHAP. LXXX.

Curcus. White Nuts.

THere groweth ſaith *Garcias* in divers places of *Malavar*, a certaine Plant which is ſowen and hath the fruite thereof hanging downe from the branches that are like unto Hazell Nuts, but not ſo round, and white of colour, whoſe kernell is ſweet ſomewhat like unto Muſhromes, or *Spaniſh* puffes, when they are boyled and dreſſed: they call it *Quiviquilenga* in ſome places (which ſignifyeth ſaith *Garcias* a ſmall *Inhame*, but *Cluſius* ſaith he knoweth it not, except it be the *Traſi dolce*, or *Juncia avellanada*) and in *Malavar Curcas*, and in *Cambaya Carpata*: theſe ſaith he, are not put to any uſe in phyſicke that he knew: he doth conjecture that *Serapio* meaneth this fruite by the name of *Habaconlcoul*, which ſaith he, breedeth abundance of ſperme, but bringeth the paſſion of the chollicke therewith.

CHAP. LXXXI.

Caceras Indorum. Indian Traſi rootes.

THis roote groweth within the ground like as Traſis doe, ſhooting forth ſtalkes in the dry time of the yeare, having leaves like the water Flagge, or Corne Flagge, one foulded within another: theſe rootes being dryed taſte like unto Cheſnuts: but while they be greene or before they be dryed, they are unpleaſant. *Cluſius* thinketh that theſe rootes be the *Malinathalla* of *Theophraſtus*, *lib.* 4. *c.* 10. or the *Anthalium* of *Pliny*. About the River *Maragnon* in *Peru*, grow certaine fruits under the ground like unto *Spaniſh* balles, of the length and bigneſſe of halfe ones fingers, round and ſomewhat writhed, of a brownish colour, having within it a ſmall nut like an Allmond, which will rattle being ſhaked when it is dry, browne without and white within, parting in two parts as an Allmond, of as good a taſte as a Filberd, both raw and roaſted, but procuring headache if too liberally eaten: they dry and ſtrengthen the ſtomacke, and are eſteemed as junkets with the Indians and *Spaniards*.

Fructus ſub terra naſcentes. Quere de Manobi ſupra.

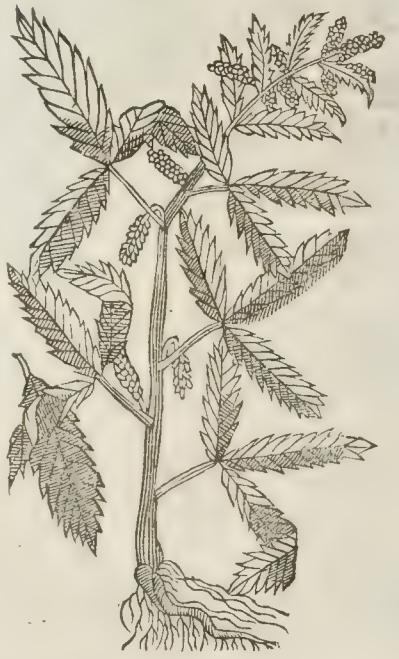
CHAP.

CHAP. LXXXII.

Bangue. The Indian dreamer.

THis herbe groweth up with hard ſtiffe ſquare ſtalkes like unto Hempe, yēt tough and not eaſie to breake nor ſo hollow as Hempe, whoſe barke may be drawne into threds as well as Hempe (yet *Garcias* ſaith the ſtalke is wooddy, with but a little barke) of a pale greene colour: the leaves are like unto thoſe of Hemp, dented about the edges, greene on the upper ſide, and gray or hoary underneath, of a dry inſipide taſte: the ſeed is like unto Hemp ſeed, but leſſe and not ſo white. The Indians of the Eaſt Countries uſe both leaves juyce and ſeed thereof, for many purpoſes both good and bad to ſtirre up an appetite to meate, and the validity of venerious actions, whereunto they are mighty prone and proclive, and wherein is their chiefe felicity, eating the leaves or ſeed alone, or with ſome Sugar, divers alſo doe diverſly compound or mixe it, ſome putting thereto in pouther *Fauſel* or Nutmegges, or Cloves, or choyſe Camfire or Muske, or Ambar, according to every ones fancy and ability, or as they would be intoxicated, for it will drive them into ſleepe, and then grow great dreamers according to their humours and diſpoſitions, but if they take it with *Opium*, as the great men and Souldiours oftentimes doe it, will cauſe deepe ſleepes to make them the more able to undergoe their ſore labours, travaile, and watchings in the warre, and to forget them alſo. But the women oftentimes abuſe their husbands hereby in giving it them to fulfill their luſt before their faces. Although this plant be in face like unto Hempe, yet the qualites are quite contrary.

Bangue. The Indian dreamer.



CHAP. LXXXIII.

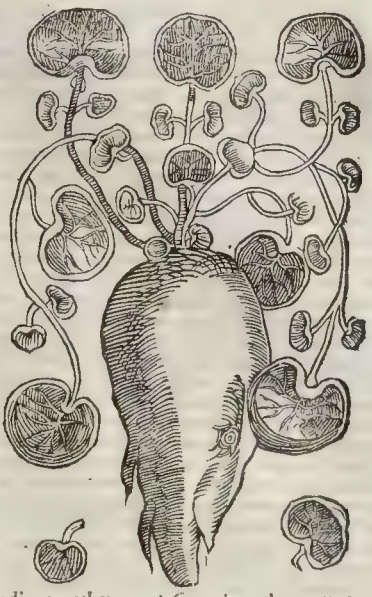
Hiucca ſive Manihoca ex qua Cazavi fit. The true Indian *Hiucca* whereof the Indians bread *Cazavi* is made.

THe plant hereof groweth like a ſmall ſhrub or buſh of Elder, and is accounted to be of two differing ſorts of leaves, and riſeth to be ſixe or ſeven foote high, with ſundry wooddy ſtalkes, bearing many faire broad leaves thereon, divided into ſundry parts, like unto *Helleboraſter*, or the fingers of ones hand, ſeven or eight together, upon a long footeſtalke, each part of them being halfe a foote long, and three inches broad, but not endented about the edges, abiding alwayes greene: the one ſort of leaves are ſomewhat broad towards the points, the other narrower, it hath ſaith my friend that gave me the intelligence, a ſmall ſpotted flower, but what fruite followed, hath not yet beene ſignified by any: the roote groweth quickely great, for it is uſually planted every yeare, or every other yeare, and becommeth as great and long as a good great Carrot roote, browne on the outſide, and very white within, the manner to propagate it is, to cut off a ſtalke about a foote long, and put it more then halfe way into the ground, where it will quickely take roote, and within a yeare or little more be fit to take up and uſe againe. Of this roote did the *Americanes*, notwithſtanding in many places they had *Maiz*, which is Indian Wheate, both in the Iſles and in the Continent, for many hundreds of yeares make their bread whereon they lived in this manner: Having pared away the rinde, they ſcraped or broke ſmall the roote, which is white, ſappy, and full of ſubſtance, from whence they preſſed out the juyce which they kept by it ſelfe, having an evill ſmell, whereof whoſoever taſted, either man or beaſt, dyed without remedy, and that quickely, but if they boyled it to the halfe, it would become a good wholeſome drinke although like ſmall Ale, and if ſet in the Sunne it would be as good vinegar as might be of Wine, and if it were boyled thicke, it would be ſweete as hony, and ſerve for that purpoſe: the maſſe from whence the juyce was preſſed, they did put into a panne and ſet it over the fire to make it grow thicke, and being dry, they made it into pouther, and putting water thereto they formed it into ſmall cakes, and dryed them in the Sun, which they kept for their uſe, and would abide good for a long time, twenty yeares without corrupting, giving good nouriſhment to the body, although it would exaſperate the jawes and throate in eating thereof, for which purpoſe they had need of water, or other liquour, to moiſten it often, or elſe it would be hard to ſwallow, being ſomewhat harſh and ſharpe in the throate. This ordering of the roote to make poyſon wholſome, is no leſſe admirable then

that

Hiucca sive Mandiocæ genuinæ Mexicanæ species duæ foliis Cannabinis. Two sorts of the true West Indian Hempe leafed *Hiucca.*

Hetich Americanum. Mallow leafed Potatoes.



that the juyce of this roote groweth on the Vpland in the Continent, is not any whit hurtfull, as it is said, although it be hurtfull in the Islands: & this bread was used by all the people of *America*, from *Florida* to *Peru*, and about to the Straights of *Magellane*, above a thousand miles, yet had they *Maiz* also, that is, Indian or Turky Wheate, in most of those places. The Names hereof are very various, according to the Country, for it is called *Manihot* by some, *Hiuca*, *Hiucca*, or *Iucca*, according to others, and *Cazavi*, as they call the bread which the *Spaniards* doe write *Cacavi*, that is *Casavi*, which is the most generall name through all places. We have not heard that the Indians used either herbe or roote to any Physicall remedy.

Like hereunto is that which is called *Hetich* by the Indians, whose leaves are round like Mallowes, and the roote like unto great long Turneps, being of two sorts, the one being yellowish the other white, when they are boyled or baked into bread, and is planted from peeces cut off from the roote. Some would referre this to the *Pingum* of *Theophrastus*, which *Pliny* calleth *Oetum*. *Hetich Americum.* Mallow leafed Potatoes.

CHAP. LXXXIV.

Cevadilla sive Hordeolum causticum Americanum. The Indian Causticke Barley.

Monardus saith that among other rare seedes and plants, that were sent him from *Hispaniola*, he had this also, which they there called *Cevadilla*, that is to say *Hordeolum*, Small Barley, from the likenesse of the spiked head of seed unto an eare of Barley but lesser, having the seed enclosed in the like chaffie huskes, but is like unto Linseed, yet greater, whose property is more admirable then ever was heard of in any other herbe or seed, for neither *Sublimatum* nor fire it selfe can effect more in a cautery to be used, therefore it will kill the wormes that breed in foule ulcers, and clenseth those that are foule and stincking, by casting some of the pouther thereinto, yet with discretion, according to the greatnesse and foulenesse of the sore, and using those remedies that are fit for it, but if it chance to worke too eagerly or sharpely they use to dippe tents in Rosewater, or Plantaine water, and put them into the ulcers, it is used in the like manner, for the sores of beastes: this seed is hot in the fourth degree, and beyond it, if there were any further degree to be rekoned,

Millo is a graine or kind of Corne like Millet, used both for bread and drinke in the Kingdome of *Sabo* in *Guinea*, remembred in the Sea voyages of *Vanderhague*, in *Clusius* his *Curæ posteriores*.

Cevadilla sive Hordeolum causticum Americanum, The Indian causticke tree.

Millo.

CHAP. LXXXV.

Anana seu Pina. The West Indian delitious Pines.

THe Pines (so much esteemed for the most excellent and pleasant sweete fruite in all the West Indies) is the fruite of a kinde of Thistle, growing with many long, hard, rough stiffe and narrow leaves, thickest in the middle, and thinne, cut in and dented about the edges, with reddish points, seeming prickely like a Thistle, but are not, from the middle whereof riseth up a round and shorter stalke, then that of the wilde sort set with the like leaves but lesser, and at the toppe one head, of the bignesse of a reasonable Muske-Melon, or Pome Citron, of a yellowish greene before it be ripe, and more yellowish, being through ripe, shewing as it were scaly like an Artichoke at the first view, but more like to a Cone of the Pine tree, which we call a Pine Apple for the forme, yet the outside hath no hardnesse at all therein, but may be pared and cut like unto a mellow Cotone Peach, being so sweete in smell that they may be perceived where they be afarre off, of a farre more pleasant sweete taste and substance then it, tasting like as if Wine, Rosewater, and Sugar, were mixed together, having no seede at all in it, whereby it may be encreased: but as some others say, it hath whitish seed like a Muske-Melon, but lesser and longer; this fruite beareth a bush of leaves at the toppe, and some small heads on small branches underneath it, which being taken from it and planted halfe way deepe in the ground will take roote, and beare fruite the next yeare, which is the onely manner of propagating. In *Brassill* is said that they have sundry sorts hereof, one they call *Iajama*, which is longer and pleasanter then any other, and of a yellowish substance: another they call *Bonjama*, being whiter within, and of a mawmish taste, with the lusciousnesse: a third they called *Ijagna*, white also within, but tasting like sweete Wine with a little tartnesse. The roote is great with many strings thereat, but perisheth with the stalke after the fruite is ripe. It was first brought from *Santa Cruise* in *Brassill* where it is naturall, into both West and East Indies, being not naturall to either of them, but is onely manured there, and now is growne plentifull: they of *Brassill* call it *Nana*, others *Anana*, the *Spaniards* and *Portugalls Pinas*, from the likenesse, and so doe most Countryes, following that name, *Oviedus* in his History calleth it *Iajama*, and *Thevet* in his singularities maketh mention of another fruite very like hereunto but growing upon a tree like the Mulberry, with long broad leaves like Angelica, in an Island of the East India called *Necumeré*, which fruite they call *Melenken*, and tasteth as if Sugar and a little Nutmegge were mixed together, which the Natives eate to quench their thirst. The chiefest time of their ripenesse is in the Lent, when they are sweetest. But this *Pina* as I said, surpasseth all other fruites of the West Indies, for pleasantnesse and wholesomenesse, so that many eate them abundantly, and thinke they cannot sufficiently be satisfied with them,

Anna seu Pina.
The West Indian delitious Pines.

Anana silvestris.
Wild Indian Pines.

but

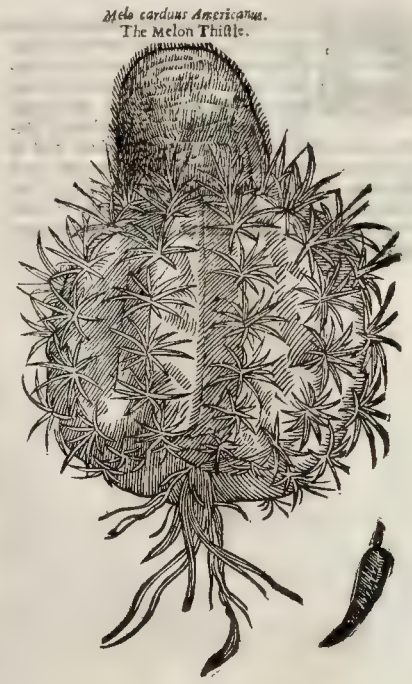
but the furfet of them is dangerous, even as it is vſuall of the beſt fruits: it is not vſed Phyſically hitherto that I can learne, but *obſaporis gratiam* wholly ſpent and eaten: the Phiſitions there forbid it their ſicke patients, becauſe it is ſomewhat too hot and might breed inflammations. Some admirable things are reported thereof, one is that if one of theſe fruits be cut through the middle with a knife and they joyned together againe, the peeces will joyne and ſticke ſo faſt together as if it had not beene cut at all: another propertie it hath, that if one cut the fruit with a knife and leave the knife ſticking therein untill the next day, ſo much of the blade thereof as ſtucke within the fruit will be found wholly conſumed and waſted, or as it were eaten away: the knife alſo that did cut one of them if it be not ſodainly wiped but let alone unwiped will ſeeme as if it had beene eaten in with *Aqua fortis*.

There is another wild kinde of *Pinas* growing naturally both greater higher and more prickly or Thiſtlelike, having a great tuft of leaves at the bottome of their ſtalkes or ſtems next the ground ſeeming to be Aloe leaves a far off but leſſer, and of a pale greene colour ſet with ſharpe prickes, it is encreaſed by the ofſets, one riſing from another: from the maine ſtem grow ſundry branches bearing at their ends, heads of ſoft tender leaves cloſed round together, which are nothing but the flowers, and are of a yellowiſh colour ſmelling very ſweet out of theſe heads riſe ſpikes not unlike to thoſe of the Reede but thicker, cloſer ſet and farre more beautifull, ſmelling like the Cedar: from the branches hang downe the fruit called by the *Portugalls*, *Ananas bravas*, that is, wild *Ananas* or *Pinas* which doe ſomewhat reſemble the former or manured kinde, of the bigneſſe of a Melon, of a beautifull red colour very pleaſant to behold which is divided into parts like unto Cipreſſe nuts when they are dry, and ſet with bunches or knobs, very neare reſembling a Cone or Pine Apple, which are nothing ſo good although a little pleaſant, yet ſomewhat harſh withall, whereof few doe eate or take pleaſure in them, and give as little good nouriſhment when they are eaten, and is therefore more Phiſically vſed, for ſix or eight ounces of the juice taken in a morning faſting with ſome Sugar, is a moſt preſent and certaine remedy againſt the heate or inflammation of the liver or backe, as alſo againſt the Vlcers of the Kidneyes, and foule purulentous urines and the excoriations of the yard: all which diſeaſes this cureth upon three times taking.

CHAP. LXXXVI.

Melo carduus Americanus. The Melon Thiſtle.

THis admirable plant or fruite hath neither leafe nor ſtalke, but riſeth immediatly out of the ground, from a ſmall whitiſh rough ſtringy roote and many ſmall fibres thereat, into the forme of a Muſke Melon for the bigneſſe, but made Cone faſhion, that is, broad and flat below, and ſmaller up to the toppe, having round about it foureteene ribbes ſet with ſharpe crooked prickes ten or twelve together like a ſtarre in ſix, ſeven or eight places of every ribbe and furrowed betweene, of a yellowiſh greene colour: from out of the toppe whereof thruſteth forth ſundry ſilkelike downe or Cottony threds, as the Artichokes and other Thiſtles doe, within which lye when they are ripe ſmall long ſlender pointed ſheathes or cods, of a perfect crimſon colour, reſembling the long codded *Capſicum* or *Ginny* Pepper, wherein is contained ſmall round ſeed like the *Amaranthus*, ſet with hard yellowiſh prickes at the head: the rinde hereof is hard and thicke like unto a Melon, which may be pared away like it, under which the pulpe or meate lyeth white in colour, fatty in feeling of an unſavory ſower taſte, wateriſh and cooling. This plant groweth neare the Sea ſhores in divers Iſlands of the Weſt Indies as Saint *Margets*, Saint *Iohns*, and others neare unto *Puerto ricco*. One of the fruits hath beene brought from thence to us that hath weighed ſeven pounds and twelve ounces. We know of no other uſe this fruit is put unto, but that in the hot time of the yeare they eate it to quench their thirſt and coole the heate of their ſtomackes.



Melo carduus Americanus.
The Melon Thiſtle.

CHAP.

CHAP. LXXXVII.

Cardum Pitahaya Americanorum. The blood red ball Thistle.

THis Thistly fruit is described by *Oviedus*, growing in the Island of *Hispaniola* which is round, and as bigge as ones fist, and somewhat long, having a shew of scales on the outside: the barke or rinde whereof is thick but may easily be cut or pared, under which the pulpe or meate is like unto a Figge with graines or kernells among it, as it hath, but of a pleasant deepe crimson colour, which coloureth their fingers like Mulberries that eate them, and after two or three houres that they have eaten them their urine will looke whitish, the fruite hath neither leafe nor branch, but riseth up in the middle of many great foure square armes of six foot long a peece channeld in the middle, and both there and at the edges set full of most sharpe but small prickes, three at a place together at certaine distances one from another, the whole plant and fruit is of a pale greene ash colour.

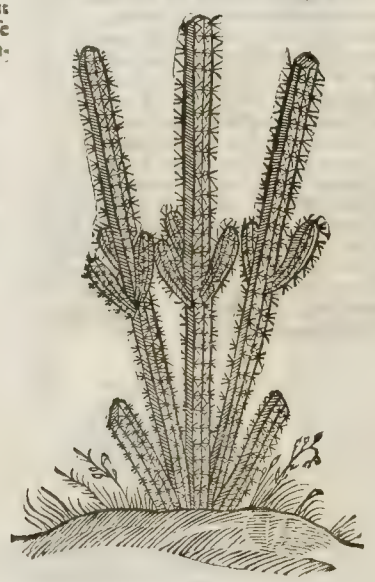
Cardues Pitahaya Americanorum.
The blood red ball Thistles.

CHAP. LXXXVIII.

Cereus spinosus Americanus. The Torch Thistle of *America.*

THis small plant seemeth somewhat like the last, but that it riseth up with divers stalkes 19. or 20. cubits high, with some outward ribbes all the length of them, and set at severall spaces with small short thornes standing like small starres, the forme of them very like unto the Melon Thistle, these stalkes have some short branches, and at the toppes flowers like the purple Foxglove, and fruite following of a bright crimson colour like a Figge, but without taste, the stalkes are wooddy of the bignesse of ones wrist of a gristly substance, and of a bitter gummy taste like Aloes.

Cereus spinosus Americanus.
The Torch Thistle of *America.*



CHAP. LXXXIX.

Planta pinnata arundinacea ſpinoſa. The winged thorny Reede.

THis Reedelike thorny plant came likewiſe with the two laſt recited plants from thē Weſt Indies which was like a ſtaffe of a Reede full of pith of eight or ten cubits in length having a threefold waved skinny welt of a fingers breadth ſet thereon all the length thereof and at the outer ends of the waved welt ſmall ſtarres of ſharpe pricks or thornes: more hereof cannot be ſaid for that more was not brought, but that thereby you may behold the admirable workes of God in plants as well as in all his other creatures.

Hereunto is adjoyned another thorny plant brought from theſe parts, which ſeemed either the body or the branch of a blacke berry like tree, being a ſolid firme heavy wood, armed very thicke with great long and ſtronge thornes at certaine tubers or knots, the barke being thicke and blackiſh.

Planta pinnata ſpinoſa & Rubi facie ſenticoſa planta. The ſtarre Thiſtle-like plant of *America*, and a bramble buſh like ſtalke of *America*.

Rubi facie ſenticoſa planta.

Obſervē I pray you that the former of theſe two deſcriptions belongeth to the *Cereus ſpinoſus* and that deſcription to be ſet in the place of it.

CHAP. XC.

Cannæ Indicæ portentoſæ longitudinis. Indian Reede ſtaves.

ON thē Weſterne ſide of *Sumatra* and in other places alſo of thoſe Indies grew Canes (for wee know not how elſe to terme them) or Reedes called by them *Rattan* of an incredible length, for riſing from the ground, they will mount up to the toppe of the higheſt tree in growth there next unto them, and deſcending to the ground againe, it will runne thereon on a great way, and ſometimes divide it ſelfe to ſeverall wayes, and afterwards coile it ſelfe as a Cable is laid on ſhipbord or elſe where, to the length of thirtie fathome by computation, and then runne againe over a tree ſometimes or elſe coile it ſelfe againe as formerly, ſo that neither beginning or end thereof is found: it hath not beene obſerved that it hath any leaves on it, but are very plyant and bending as one will while they are freſh and greene, and would ſerve in ſtead of ropes: but when they are old and dry, they will ſerve in ſtead of walking ſtaves, as they are much uſed with many of us now a dayes or to any other ſuch purpoſe, they are no harder or bigger then an ordinary cudgell, yet may one ſtrike fire from them by ſtriking one againſt another, which nevertheleſſe are porous and hollow as it were in the middle, ſo that one may blow winde through them at never ſo great a length, and at a reaſonable ſtaffes length almoſt ſo ſtrongly, to blow out a candle ſet at the further end, at the leaſt ſenſibly to be felt, yet no appearance of holes therein. I take it to be the ſame that is called *Iuncus Indicus poroſus* in *Cluſius* his *Curæ poſteriores*, but why *Iuncus* I ſee no reaſon.

CHAP. XCI.

Canna ingens Mambu vel Bambu dicta. Huge great treelike Canes or Reeds.

THere hath beene brought us from the East Indies Canes or Reeds of a wondrous bigneſſe and height, (as may be gueſſed by the broken peeces) growing in *Malabar* chiefly about the Sea coaſts, whereof the inhabitants make poſts to build their cottages withall, as alſo doe cut them at a certaine length like unto a Cowleſtaffe to beare burthens, and bend them while they are freſh that they may bee a little crooked and hollowiſh, to hange a Palankin, that is a couch or litter wherein perſons may bee carried in their journying from place to place or otherwiſe for ſtate or eaſe, by two or foure Indians: one peece having ſix joynts was eight foote long, each ſpace betweene the joynts being a foote and foure inches: it was five inches over at the bigger end, and almoſt as much at the leſſer: the circumference or compaſſe about at the lower end; being ſixteene inches and almoſt as much at the upper: the thickneſſe of the wooddy compaſſe of the Cane was about three inches by meaſure: and was all overlayd with *Laak* or *Gum Lacca*, or hard Wax to keep it from the weather, and from cracking in the Sunne, being found in the great Admirall Carrack or ſhippe of the *Portugalls*, that brought home the Victroy of the Indies, and was taken by our Engliſh 1593. as a Prize; but greater and longer Reedes were brought from thoſe parts by the *Hollanders*, yet not whole but broken, the leaſt whereof was 26. foot long, with 19. joynts therein, being 17. inches about at the lower end and 14. at the upper: a greater was a foote and a halfe longer and three inches more in compaſſe than the former, the diſtance betweene the joynts being neare the length of the circumference, or not much differing any where; the thickneſſe likewiſe being three inches or thereabouts as in the former: by theſe peeces may bee gueſſed of what huge height theſe Canes were: at the plants of their Pepper doe they oftentimes faſten downe theſe Reedes, that the Pepper in the growing may leane thereunto, and be ſuſtained by them, which without ſome Proppe or ſtay would lye downe on the ground and become unprofitable. In ſome places of the Indies ſay both *Garcias* and *Acoſta* theſe Reed like trees grow ſo great, that ſometimes of them are made ſmall boates, ſufficient to hold two naked Indians, which they cleave in the middle and cut off beyond the two joynts, ſo that an Indian ſitting at each end, joyned knee to knee, and a ſmall Oare in each of their hands of halfe a yard long, they will ſo nimbly force the Boate, yea even againſt a ſtreame that it is wonderfull to behold, which as *Acoſta* ſaith he ſaw in the River *Cranganor* where many Crocodils breede which are moſt fierce and tetrible, and will aſſaile ſhippes and other ſmaller veſſells to get ſome prey out of them: but as it is ſaid will never make aſſault againſt any of the boats made of this tree or reede, nor againſt them in it. Of the roote of this tree being burned is made *Tabaxir*, that is, the *Spodium* of the ancient Authore, as *Avicen* thoughe, and ſo *Gerardus Cremonenſis* and *Bellunenſis* doe alwayes tranſlate the word *Tabaxir*, but *Garcias* ſheweth that it is a very falſe interpretation, there being but one *Spodium* of the Greekes which is our *Lapis tutia* uſed by them onely in outward medecines, for *Tabaxir* being a Perſian word ſignifieth nothing elſe but a milky juice or liquor growne thicke, and hereby the *Arabians* do ſtill call that concrete or hardened liquor that groweth betweene the joynts of this Reede or Tree, but the Natives of *Sacar Mambu*, that is Sugar of *Mambu*, but is not found in all places as *Garcias* ſaith, but in *Biſnagar*, *Batecala*, and ſome part of *Malabar* chiefly, and is ſeene to bee of ſundry colours, as white like Starch which is the beſt, yet is it found ſometimes of an aſh colour or blackiſh, which yet is not to be miſliked, for ſo it is to be taken out of the Canes, and hath beene in former times eſteemed of the value of ſilver, and yet holdeth a great price even with the Indians, &c. there had neede therefore of great caution of uſing *Spodium* (as it is taken) in the *Arabians* medecines, which are for the moſt part all inward which is farre differing from *Tabaxir* as you here ſee, and of all is taken for the fitteſt *Antiſpodium*, and thoſe other of Oxe bones burned and the like to be utterly caſt away. The tree hath leaves ſaith *Garcias* like an Olive but longer: the properties whereof are effectuall eyther in outward or inward heates, hot chollerick Agues and fluxes that come of choller to coole, temper and binde them. And now that I have ſhewed you all the Phyſicall herbes let me deſcend to the trees and prepoſe them that have delightfull and pleaſant fruits, that you may take therein ſome pleaſure to mix with the profitable or admirable that ſhall follow: and the firſt that I will propound as *Garcias* ſaith is the chiefeſt and choyſeſt fruite in all the Indies.

Canna ingens Mambu vel Bambu dicta.
Huge great treelike Canes or Reedes.

CHAP. XCII.

Mangas. The Indian hony Plumme.

THis tree groweth tall like a Peare tree, with somewhat long leaves, more like unto a Peach then a Plumme: the flowers grow from among the leaves, many being set on a long footestalke like the long Birds Cherry, or cluster Cherry, after which follow the fruite, some being as bigge as a small Melon, and weigh neere about two pound, the lesser about the bignesse of a Goose egge, and others betweene these sizes, as the climates and fertility of the soile causeth them, all of them being longer then a Plumme, and with a thinne skinne, greene before they be ripe, but of a yellowish greene and some reddish when they are ripe and shining withall, smelling very well, but tasting much better, and sweeter, so that some are to be eaten when others are reserved to stand, having a long stone in the middle like unto a long Allmond in the shell, but covered with a whitish downe or freeze, and a white bitter kernell within: Some trees beare twice a yeare, in the Spring and Fall: but generally they are ripe according to the heate, and temperatenesse of the climate even from *Aprill* unto *November* in one place or another. for they are found in many Provinces of India, as *Malabar*, *Balagate*, and *Bengala*, *Guzarate*, *Pegu*, *Malaca*, *Goa*, & *Ormuz*, which are accounted the best, and called generally *Mangas* by the Indians, yet by some *Ambo*, and by the *Turkes* and *Persians Amba*. The fruite is ordered many wayes, as either preserved in Sugar, or pickled up like Ollives before they be through ripe, and are then somewhat harsh and binding: or eaten fresh, being cut into slices and dipped in Wine or without and so eaten. They are cold and moist, and yet the Indian Physitions, as well as the vulgar doe hold them to be hot, saying they breed choller-ricke feavers, inflammations, itches, and scabbes, unto all which diseases they are subject, which eate none of them at all, in respect of the heate of the yeare, when those fruites are chiefely ripe and are eaten. *Acosta* pictureth this tree with flowers, and the fruite much differing from this of *Linschoten*.

There is another kinde found growing in some places, but much more rarely, whose fruite hath no stone within it, else not differing.

There is likewise a wild kind hereof called *Mangas bravas*, whose tree is lesser then the manured, with shorter and thicker leaves also, and the fruite is of a pale greene colour, having a thicke skinne, and but little pulpe therein, of the biggenesse of a Quince, and with a hard gristly stone within it, yet give they store of milke: they grow generally through all *Malabar*. If any one eate of these fruites although it be but a little, it is so present a poyson that they dye instantly, and herewith the Indians usually destroy one another, some putting oyle thereto, which maketh it the more speedy in operation, but howsoever it is taken it doth so quickely dispatch them out of this life, that there hath not beene hitherto found a remedy against it. Boyes, there doe usually in sport throw these fruites one at another, as in *Spaine* they use to doe with greene Orrenges,

Mangas. The Indian Hony Plumme.

Mangas sive Ossiculo.

CHAP. XCIII.

Genipat. The twining *American* Peach.

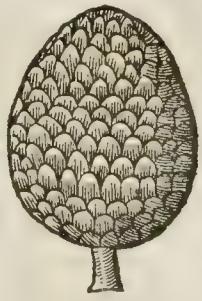
THis tree is of two sorts, the fruite of the one is edible and greater then the other, which is not to be eaten bearing leaves like the Wallnut tree, and fruite at the end of the branches, being both for colour and bignesse like unto Peaches, one set upon another in a wonderfull manner: that which is not edible hath a certaine cleare blewish juyce therein like unto Indico, wherewith the Savages dye or colour their bodyes when they have any solemne meeting of friends, or goe to the slaughter of their enemies, and they with this ornament thinke themselves as finely decked as we in our bravest silkes.

Chap. XCIV.

Guanabanus Oviedi. The Indian Scaly Muske Melon.

This delicate fruite groweth on a goodly tall tree in ſundry places in the Weſt Indies, whoſe wood is but weake, having large and long leaves, like unto thoſe of the Pomecitron tree, and very greene: the fruite is ſometime, as bigge as any Melon, and ſometimes of the largeneſſe of a middle ſized Melon, covered with a thinne ſcaly greeniſh rinde, ſomewhat like to a Pine apple for the forme, which may as eaſily be pared away as a peare, the meate or pulpe within is very white, ſweete, and delicate, and relenting in ones mouth like unto creame: the ſeedes within are great, like unto Gourdes ſeed, but ſomewhat larger and blackiſh, and are diſperſed through the inner pulpe. This fruite is cold and moiſt, and therefore of eſpeciall uſe in the heate of the yeare to coole their thirſt, and giveth no offence to the ſtomacke, although one ſhould eate an whole one.

Guanabanus Oviedi. The Indian Scaly Muske Melon.



Anon. *Oviedus* mentioneth another fruit called *Anon*, which hé compareth with the *Guanabanus*, ſaying that not onely the tree, but the fruite are very like but exceedeth it in goodneſſe, being of a firmer ſubſtance.

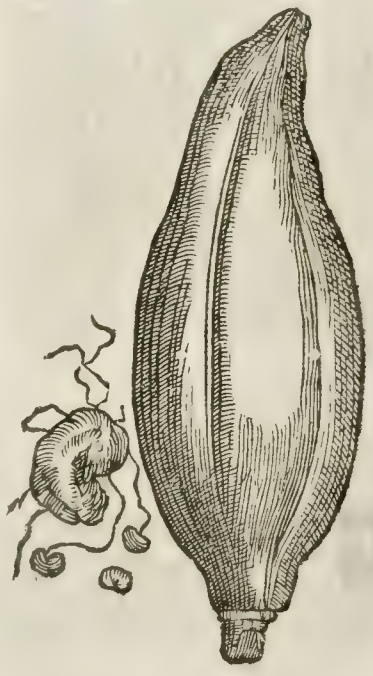
Thevet maketh mention of one very like hereunto called by thoſe of the Iland of *Zipanga* where it groweth *Chivey*, which in the *Syriack* tongue ſignifyeth a Figge. The branch being ripe is yellow, and very pleaſant in taſte, like unto Manna, melting in ones mouth, containing ſeede within them like unto thoſe of Cwcombers. The leafe is very round and greene.

Chap. XCV.

Guanabanus Scaligeri. The *Ethiopian* ſowre Gourde.

The *Ethiopian* ſowre Gourde groweth in *Mozambique*, and other parts of *Ethiopia*, on a faire great tree, having large freſh greene leaves, larger then Bay leaves, & comming neereſt to thoſe of the Pomecitron tree, the flowers are of a pale whitiſh colour, and the fruite as great as a Melon, but longer then it, and ending in a round point, whoſe rinde is hard and thicke, with ſundry ribs thereon, and covered with a greeniſh freeze or cotton: the pulpe or meate within is whitiſh while it is freſh, but ſomewhat reddiſh being dry, and then is very brittle alſo, that it may be eaſily rubbed into pouther, having diverſe large ſeed running through it of the forme of a thicke ſhort kidney or the ſeedes of *Anagyris*, the great beane Trefoile faſtened therein with ſmall fibres to the hollow middle part which pulpe as well dry as greene is of a pleaſant ſharpe taſte, yet more tart or ſowre, when it is dry then greene: this is uſed in the extremities of the hot weather to coole and quench thirſt, and is effectuall alſo in all putride and peſtilentiall feavers, the pulpe or juyce thereof taken with Sugar, or the dryed pouther put into ſome Plantaine water, or the decoction or infuſion thereof, both for the aforeſaid cauſes and to ſtay the ſpitting of blood, or any other hot fluxe of blood or humours in man or woman; this is very like to be the *Abavo* that *Honorius Bellus* writeth of in his fourth and fifth Epiſtles to *Cluſius* and the *Baobab* of *Alpinus*.

Guanabanus Scaligeri. The Ethiopian ſowre Gourde.



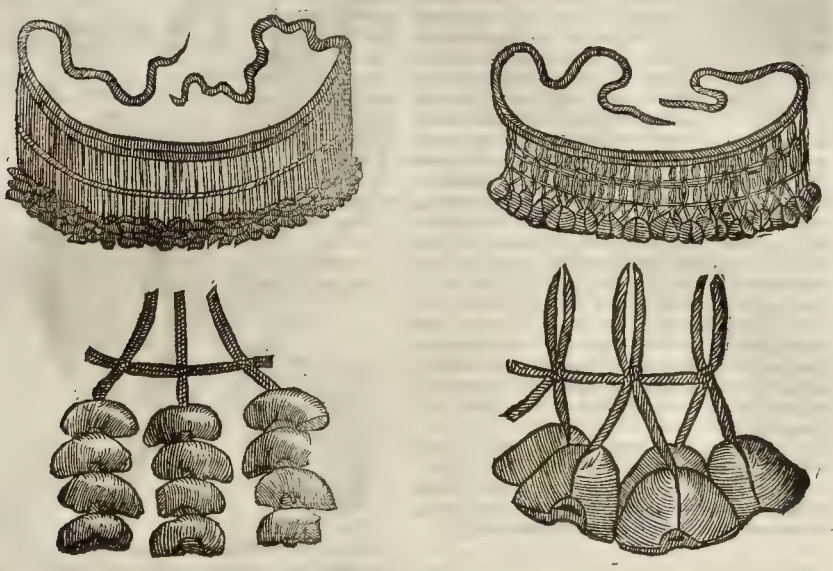
Ficus Nigritarum. Somewhat like hereunto is that fruite which *Thevet* calleth *Ficus Nigritarum*, the leaves of the tree are larger then any of thoſe former ſortes, and hath ſome diviſions therein very like unto Figge leaves: the fruite is ſometimes two foote long and thicke, according to the proportion.

Higuero Oviedi. Not much unlike alſo is the *Higuero* of *Oviedus*, which he deſcribeth in his Indian Hiſtory: The tree (ſaith he) is as great as a Mulberry, and the fruite ſometimes like unto a long Gourde, & ſometimes unto a round, of which round ſort the Indians make themſelves diſhes, platters, and ſundry other veſſels: The timber whereof is ſtrong

and

Higuero fructus Cluſij
Morrice like Bells.

Aboval fructus.
The poyſonous fruite of the ſtincking tree.



and fit to make ſtooles, chaires, ſaddles, and the like: the leafe is long and narrow towards the ſtalke, and broader towards the end, but growing leſſe from thence to the point: the meate or pulpe thereof is like unto Gourds, which they often eate in want of better food: This tree groweth in *Hiſpaniola*, and other the Iſlands of the Weſt Indies, as well as on the Continent alſo. *Cluſius* ſetteth forth other certaine fruites tyed unto ſtrings and ſtones within to ſound in dancing with them, which he entituleth *Higuero*, farre differing from this.

Aboval Theveti. The ſtincking tree with his poyſonous fruite.

It groweth as high as a Peare tree, with leaves three or foure inches long, and two broad, yeelding white milke, if any braneh bee broken: the wood ſtincketh moſt abhominably, bearing a white three ſquare fruite, ſomewhat like unto the Greeke letter Δ. whoſe kernell within is moſt poyſonous and deadly, and therefore the Indians doe give great caution to their children that they eate none of them, and themſelves abſtaine alſo from uſing of the wood to burne, but having taken the kernell they putting ſmall ſtones within the ſhells, and tying them with ſtrings they ſerve them for bracers for their legges to dance with, as Moris dancers doe with bells with us.

CHAP. XCVI.

Mamay. The Weſt Indian Peach plumme.

Caliger ſaith this tree is like the Cheſnut tree with like leaves yet greater: but *Oviedus* in his hiſtory of the Weſt Indies, deſcribeth it to be a faire great tree like unto the Wallnut tree, and with ſuch like leaves, but larger, thicker, and greener on the one ſide then on the other: the fruite is either perfect round or a little longer then round, as bigge as a good great Quince, ſome greater, others leſſer, covered with a yellow thicke skin or coate, that is ſomewhat rough and not ſmooth, the pulpe or meate whereof is very pleaſant like unto a Peach, but firmer, and not ſo ſappy as a Plumme, of a yellowiſh colour, and is of a finger or two in thickeneſſe, having in the middle two or three kernels, ſeparated by thinne skinnes, that are of a peeled Cheſnut colour and taſte, but very bitter in the inner kernell.

CHAP. XCVII.

Guajave arboris ramus & fructus. The West Indian Bay Plum.

Guayava. The West Indian Bay Plumme.

THis tree (which is very frequent and well knowne through all the West Indies, and which they call *Guayabo*, as they doe the fruite *Guayaba*,) groweth great like unto an Orrenge tree, but thinner of branches, bearing large leaves on them, two alwayes set together, and opposite which are like unto Bay leaves but larger, even foure inches long, and one and a halfe, or two inches broad, gray or of an hoary ash-colour underneath, with great ribs and smaller veines therein, but of a sad greene above, smooth, and without any shew of veines almost, somewhat hard in handling, and both smelling and tasting somewhat like a Bay leafe: the flowers are like those of the Orrenge or Pomecitron tree, smelling sweete like the Iasmine; after which followeth the fruite, as great as a small Apple, and like unto a Plum, that is, somewhat long, greene before it is ripe, and yellowish after (yet *Clusius* saith that he received one from Doctor *Tovar* out of *Spaine*, that was blackish, light and shrunke, which he imputeth to the unripenesse of it) some having a reddish pulpe within, and some a white, very sweete and delicate in taste, divided as it were into foure parts, in each whereof lye many small graines or hard white kernells. The properties of the fruite besides the delicacy to be eaten, hath an astringent power therein to stay laskes, especially if they be eaten while they are greene and not ripe.

CHAP. XCVIII.

Ambares. The hard gristly Plumme of India called *Ambare.*

THe leaves that grow on this great tree, called *Ambare* by all the Nations there abiding, although they seeme somewhat like those of the Wallnut tree for the largenesse, yet are they not of that fashion, for being small at the bottome, and they are broadest at the end, and a little dented in in the middle thereof, elaborate with many veines, and of a pale greene colour: the flowers are small and white, and the fruite that followeth of the bignesse of a Wallnut, with a smoother and paler greene skinne, of a strong heady sent, and sowre harsh taste being unripe, but yellow when it is ripe, and of a more pleasant sent, containing a hard gristly substance within them, with sundry crosse hard nerves or threds running through, yet of so pleasant a tart sowre taste that commendeth it much, and therefore are used by the Natives and strangers also instead of vinegar, or such like sawse, to relliſh their meate, and stirre up an appetite, being eaten with salt and vinegar, while they are fresh or pickled to serve for the yeares following, which endure very well: they use to give the fresh fruite also to those that have hot agues, to coole their blood and humours.

Ambares: The hard gristly Plumme of India called *Ambare.*

CHAP. XCIX.

Melo Corcopali. The *American* Quince Melon tree.

Corcopall, is a Province of the Indies, wherein as alſo neere the *Promontori Comari*, groweth a tree like unto the Quince tree, both for forme and leafe, bearing a large fruite as great as a Melon, with ribbes on the outſide like thereunto, very ſweete and pleaſant to be eaten, and phyſicall alſo, within which lye three or foure graines or kernells like Grape ſtones, which are as bitter as Cherry ſtone kernells: the ſicke as well as the ſound doe eate of this fruite, having a quality therein to evacuate evill humours.

In the ſame Province alſo of *Corcopall* groweth a white Medlar as great as an Apple. *Meſpilum album.*

CHAP. C.

Durian. The Melon like bearing Orrenge.

THis Melonlike bearing Orrenge is a fruite called in *Sumatra*, *Durian*, is alſo ſomewhat like unto the former *Corcopall*, which is as great as a Citrull Cowcumber, having within it five fruites in ſhape and biggeneſſe like Orrenges but longer, and taſte like unto freſh ſweete butter.

CHAP. CI.

Carcapuli. The Indian yellow Orrenges of *Malavar*.

Coſta maketh mention of a great tree in *Malabar* called *Carcapuli* differing from the *Durian*, for the fruite he ſaith is like an Orrenge, when the outer pill is taken away, which conſiſteth of ſundry lumpes of pulpe, not to be ſeparated as they may be in the Orrenge, whoſe rinde is thinne, ſmooth, and ſhining as gold when it is ripe, of an auſtere taſte, and binding quality, yet pleaſant, and are good to ſtay fluxes of all ſorts, and to refreſh a dejected appetite, taken with ſowre milke or boyled Rice; the Midwives give it women in hard labour, to cauſe a ſpeedy delivery, as alſo to expell the afterbirth: the juyce is profitably uſed to cleare the eyes of miſts and rheumes.

Carcapuli. The Indian yellow Orrenge of *Malabar*.

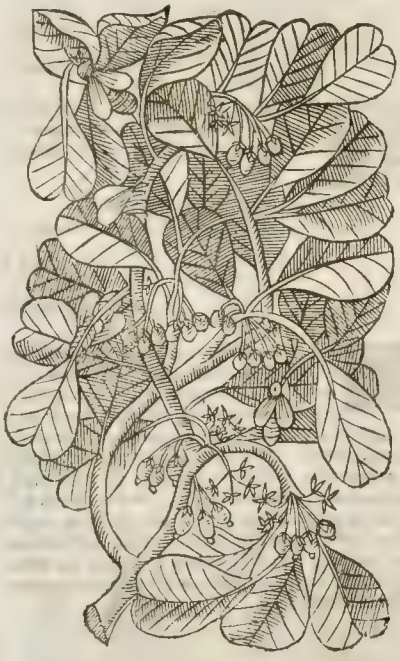
CHAP.

CHAP. CII.

Mala Indica Lusitanis Ber & Bor Acosta. Small Indian Apples.

THe tree that beareth this fruite is great, full of branches and leaves, which are somewhat like Apple-tree leaves, but longer and not so round of a sad green on the upper end, & hoary or woolly on the underside, astringent in taste: the flowers are white, made of fine small leaves without any sent, the fruite is of the bigneſſe and likeneſſe of the *Iujube* fruite or plant, some greater and lesser as well as pleasanter then others, yet in the ripest (which it is seldome seene, that they come to perfect maturity, neither will they last to be transported into other Countries) they hold a certaine binding property, and are good therefore to binde the loose belly, but are not so good as *Iujubes* for the stomacke. In *Canara* and *Decan* they call the tree *Bor* or *Ber*, and in *Malayo Videras*, but the *Portugals Manſanas de la India*, that is *Mala Indica*, whom wee have followed: those that grow in *Malaca* are preferred before those of *Malabar*. In Summer these trees are continually seene loaden with those flies (or winged Antes) that worke gum *Lacca* thereon.

Mala Indica Lusitanis Ber & Bor Acosta.
Small Indian Apples



CHAP. CIII.

Iamboloins. Indian Ollives.

THis tree is somewhat like the Lentiske tree in the barke thereof, but the leaves are like the Strawberry tree with dented leaves, tasting like the Mirtle leaves when they are greene, the fruite is very like unto ripe Ollives, but of an harsh and binding taste, able to draw ones mouth awry, yet being pickled up like Ollives, they relliſh reasonable well and serve to procure and whet the appetite, being eaten with boyled Ryce.

CHAP. CIV.

Carambolas. Furrowed tart Indian Apples.

THe fruite, which they of *Malabar* call *Carambolas*, and *Camarix* or *Carabeli*, by those of *Canara* and *Decan*, and *Bolimba* in *Malayo*, groweth on a tree much like to a Quince tree, whose leaves are longer then Apple tree leaves, of a sad greene colour, and bitterish in taste: the flowers are of a dainty blush colour, but without sent, and of a sower or tart taste like to Sorrell: the fruite is of the bigneſſe of a good egge, but somewhat long withall, yellow on the outside, hanging by a short

and ſhort ſtalke, and ſet in the ſmall huske, that formerly held the flower, being pointed at the end, divided as it were into foure parts, with furrowes, which being deepely impreſſed therein, make it the more gracefull, of a pleaſant tart taſte, very pleaſing to the palate and ſtomacke, in the middle whereof are contained ſmall ſeedes. Theſe fruites are much uſed as well to pleaſe and ſtirre up the appetite by reaſon of their pleaſant ſharpeneſſe, as in hot and chollericke agues alſo, either the juyce of them made into a Syrupe, or the whole fruite preſerved in Sugar, or pickled up in brine to ſerve for aftertimes: ſome uſe the juyce thereof with other ocular medicines for to take away the haw, or the pinne and web in the eyes, or any filme beginning to grow over them.

Carambolas. Furrowed tart Indian Apples.

CHAP. CV.

Iambos. Blood red, and bluſh Peares of India.

THere is another Indian fruite worthy to be remembred as well for the beauty it beareth in the ſhew thereof, and the ſweete ſent and taſte it carryeth to the other ſenſes, as chiefely for the excellent medicinall properties is now daily found out more and more in it. The tree groweth vaſte, or huge equalling the greateſt Orrenge tree in *Spaine*, largely ſpread with great armes which make a ſpacious ſhaddow: the body and branches are covered with a grayiſh barke, the leaves are very faire, and ſmooth an handfull long or more with a thicke middle ribbe, and other ſmaller veines therein, of a ſad greene on the upperſide, and paler greene underneath, the flowers are of a lively purpliſh red colour, with divers threds in the middle, very pleaſant and ſtanding in a great huske, and taſting like Vine branches: the fruite is of the bigneſſe and faſhion of a King Peare, growing out of that large huske, wherein the flower was formerly ſeated, and are of ſundry kindes, for ſome are of ſo deepe a red colour that they ſeeme allmoſt blacke, ſome have no kernell or ſtone within them, when others have one, which are the beſt: another ſort is of a whitiſh red colour, and ſhining cleare, having a hard ſtone within it like to a Peach ſtone, but ſmooth, and covered with a white rough skinne, which although it muſt give place to the former, yet may well be

Iambos. Red and bluſh coloured Peares of India.

accepted

accepted to a dainty palate, the skinne being so tender that as in a Plumme or Cherry, it cannot be pared away, the smell of each resembleth the Rose, and in property is cold and moist. The tree is never without greene and ripe fruite thereon, and blossomes also at all times, which falling abundantly on the ground, make it seeme all red therewith, the ripe fruite by the shaking of the tree are soone made to fall, and gathered from under it, as also easily gathered by hand. The Indians of *Malabar* and *Canara* call it *Iambolin*, the *Portugalls* that dwell there *Iambos*, the *Arabians* and *Persians Tuphe*, and *Tuphat*, the *Turkes Alma*. They there use to eate this fruit before meate most usually, yet they are not refused at other times also: both flowers and fruite are preserved with Sugar, and kept to give to those that have hot agues to coole their stomackes and liver, and to quench thirst.

CHAP. CVI.

Iangomas. Indian Services.

THe *Angomas* are Indian fruites like Services, growing on trees not much unlike our Service tree, both in leaves and flowers, but set with thornes, and are manured or planted in Orchards as well as found wild abroad: the fruite is harsh like an unripe Sloe when it is ripe, and must therefore be rowled betweene the fingers, to make it mellow before it can be eaten, and is generally taken to binde or restraine, whensoever there is cause of such an operation.

CHAP. CVII.

Leucoma. The Indian Chesnut.

THis tree groweth very great, and the wood is strong and firme, having leaves like to the Strawberry tree, the fruite is very like to our Chesnut, as well in colour as bignesse, as also in that white or spot thereon, but it seemed to have the kernell loose within it, for that it giveth a noyse in shaking, the fruit is ediole and pleasant, yet a little astringent.

CHAP. CVIII.

Charamei. Purging cornered Hasell nuts.

THere are two kindes of this tree, called *Charamei* by all the Indians generally, but the *Persians* and *Arabians Ambela*, the one is as great as the Medlar tree, with Peare tree pale great leaves, and yellowish fruite, somewhat like to Hasell or Fillberd Nuts, ending in sundry corners, of the taste of sowre Grapes, yet more pleasant, which they pickle up as well being ripe as unripe, and usually eate them with salt. The other kinde is of the same bignesse, but hath lesser leaves then the Apple tree, and a greater fruite, which the Indians use being boyled with Saunders & give the decoction against seavers: the barke of the roote of the former kinde, which groweth by the water sides, is chiefely used (so as it grow farre from the sea) which yeeldeth milke, by taking foure fingers length thereof, which being bruised with a dramme of Mustard seed, they give to those that are pursie and short winded: for it purgeth mightily both upwards and downewards: but if a superpurgation chance thereupon, they give one of the fruits of *Carambolas* to helpe it, or else a draught of the vinegar of *Canara* (which is nothing else but the decoction of Rice set by for a day, two or three, untill it grow sower. The fruite is familiarly eaten through all parts, unripe as well as ripe, and pickled, or eaten with salt and vinegar to procure an appetite, putting it to their meates to give them a rellish by reason of its tartnesse.

Charamei. Purging cornered Hasell Nuts.

CHAP.

CHAP. CIX.

Iaaca or *Iaca.* The Diamond fashioned Chesnut Gourd.

THis tree groweth in sundry of the Indian Ilands neare the water sides to be of a vaste bignesse, having leaves of an hand breadth with a thicke hard ribbe all the length thereof, and of a pale greene colour: the fruite is very great (not growing from the younger branches or with the leaves, but out of the body, and elder boughes thereof) long and thick, the least whereof is greater then the greatest Gourd, having a hard thicke rinde of a darke greene colour, set with short Diamond pointed like blackish prickes, which a farre off threaten danger in the handling, but shewing favour in doing no harme, which when they are ripe smel sweet, and grow somewhat soft, that they will yeeld to the pressing of ones hands, and being cut longwise, not athwart, have a thicke yellowish white meate within them, devided into sundry cells or partitions full of long and thicke Chesnut like fruites, greater then any Date, with an ash coloured outside, and white substance within like a Chesnut, which while they are raw taste harsh and breed much winde, but being roasted as Chesnuts use to be, or sodden, taste savory and stirre up venery, for which purpose the people eate them much: the whitish pulpe or substance wherein these lye is of a pleasant taste but hard of digestion, and breedeth that pestilent disease called *Mocai*, if they be much or often eaten, or that they lye corrupted in the stomack: Those that grow in *Malabar* are accounted the best, and better then those of *Goa*; *Linschote* saith the two sorts hereof are called *Girasol* and *Chambasol*, but *Paludanus Barca* and *Papa*, and that those other names doe signifie the goodnesse or meannesse of wares.

Iaaca vel Iaca. The Diamond fashiond Chesnut Gourd.

CHAP. CX.

Cachi & Ciccara. The Pine apple like Chesnut Melon.

THere is a prickly or thorny tree growing in *Malabar* which they call *Cachi* & the fruit thereof *Ciccara*, the tree is as great as a Fig tree, with Date like leaves, and hard wood like Box, which they put to many uses: the fruit groweth not on the branches, but out of the body, and elder boughes as the true Sycamore or *Egiptian* Fig doth, and is a foote in length, of the thicknesse of ones thigh, and of a browniish yellow outside when it is ripe, being formed somewhat like a Pine apple, and having many severall cells or partitions within it as a Pomegarnet hath; the inner substance whereof is somewhat firme and well sented, but tasting like a Muske Melon, a Peach, a sweete Orrenge and hony together; these cells containe in them 250. or 300. small fruits in shape and taste like Figges without skinnes, within every of which fruit is another lesser, resembling a Chesnut, which is eaten roasted by the fire as Chesnuts are, and will cracke like them in the roasting.

CHAP.

CHAP. CXI.

Duriones. The prickly fruitfull Melon.

THe *Duriones* may ſeeme the ſame with the former *Iaca*, becauſe they come neare in ſome things but they much differ in others, as you ſhall perceive by this deſcription. The tree groweth to be very great and tall, the Timber whereof is ſtrong firme and ſound, covered with a thicke aſhcoloured barke, ſpreading plentifully into branches and ſtore of fruit, having leaves that are ſomewhat long and pointed, dented about the edges, of a browniſh greene colour on the upper ſide, and pale greene underneath: the flowers are of a pale or whitiſh yellow colour, and the fruite groweth to the bigneſſe of a Muske Melon, with a thicke greeniſh rinde ſet full of ſhorte and thicke but ſharpe prickles, having ſome ſtrakes thereon as the Melon hath: it hath within it being opened foure cells or diviſions all the length of it, in every one of which lye three or foure white fruits as bigge as Hens egges (for if they containe five a peece they are not held to bee ſo good, neither yet if they looke yellowiſh, and not white they judge them ſpoiled by the wet falling into the chinkes) like unthe *Mangar blanco* of the *Spaniards*, but not ſo ſoft or muccilagie and taſte like unto Creame, ſmelling ſomewhat ſweet alſo: each of theſe fruits have encloſed within them a kernell like unto that of the Peach ſtone, which is ſomewhat long and inſipide, yet making the throate harſh like unto an unripe Medler, and therefore are not eaten: Theſe fruits are to be lightly troden on to breake them becauſe of the prickes, which to them that never did ſmell them or eate of them before, may ſeeme to ſmell like rotten onions, but having taſted of them wil thinke them both to taſte and ſmell better then other meats: for among the natives they are held in ſo good account that they thinke they can never be ſatisfied with them: but if any by eating too liberally of them ſhall feare to fall into a Surfeit, or to take any other harme by them, they ſhall be inſtantly helped and eaſed, if eyther they lay a leafe of *Betre* upon the ſtomack or eate ſome of the leaves thereof: for ſo great an antipathy there is between theſe two plants, that if ſome leaves of *Betre* be brought into a ſhippe or houſe, where theſe fruits are layd and kept, they will all rot and putrefie: ſo that it hath not beene knowne that any have taken harme by eating of them.

Duriones. The prickly fruitfull Melon.

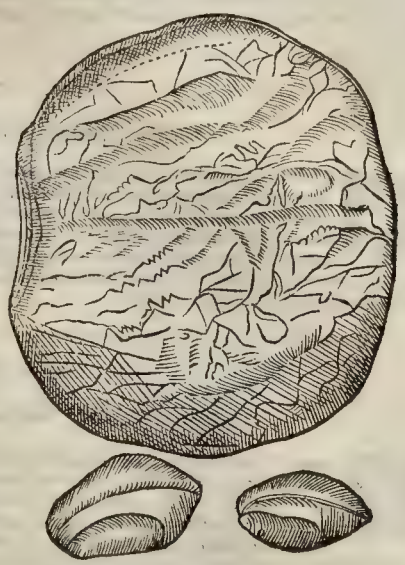
CHAP. CXII.

Totecka Americana Peruana. The Indian fruitfull Gourd bearing Almond, or the Indian Almonds of *Cluſius*.

THe tree that beareth this fruite groweth very great and high, the body being bare of branches or leaves unto a very great height whereit ſpreadeth into branches ſtanding in compaſſe together almoſt like a Crowne, with faire great broad long leaves ſet on them greater than ones hand, ſomewhat like but much greater then thoſe of *Diepanboome* of a darke greene colour on the upper ſide, and ſomewhat white or mealy underneath: the flowers breake forth among the leaves in ſeverall places, and are of a darke greene colour, after which come the fruit, very great when it is ripe and round like a Bowle, but flat on one ſide whoſe ſhell is as hard as a bone, hardly admitting to bee bored or filed, and of a darke browniſh colour dented in, ſtriped and crumpled almoſt like unto Corke, ſo great that one can hardly compaſſe it with both ones hands and the fingers ſtretched out at length, the height alſo being neare the ſame ſize; this fruite in the inſide is divided into ſix cells or particions by hard skinnes, in every one whereof is conteined eight, ten or twelve nuts lying orderly piled as it were one upon another, each of which are three ſquare, ſomewhat

what long, and pointed more at one end then another, not so much rugged as the outer shell nor so hard but they may be crakt with the teeth, some of them greater then others, and all of them two or three inches in length, and an inch and a halfe in thicknesse, the kernell within being in taste not so like an Almond as a Walnut, more oily in a wet yeare then a dry, which the Indians by pricking sundry of them upon a sticke, and lighting of them, they will burne like a Torch to shew them their way, and continue long in burning, and give an Oily or Turpentine-like flame, having a blacke coale which turneth to ashes: The outer shell hereof is of the thicknesse of halfe an inch, containing within it a pint and a halfe of liquor *Antwerpe* measure, and weighed 17. ounces or more the emptie shell: The Indians seldome gather these frũites, but gather them after they are fallen, for they are afraid least they should fall upon their heads which were sufficient to beate out their braines, and when they are forced to passe them as in their warres, &c. they carry Bucklers over their heads to defend them. They make much account of these kernells, and use to eate them chiefly to provoke them to venery, whereunto they are too much proclive of themselves, and make it their chiefest felicitie having this proverbe with them *Pignean saccumâ pingean Totocka*, which is, *Si ambires veneremede Totockam*. It groweth in high places and not in low grounds under the Line and on both sides thereof in the West Indies, and beareth fruit twise every yeare, that is, about *April* and in *November*, and call it *Totocke*. It is very probable that this is *Clusius* his *Amygdala Peruana*, as any by comparing that little he hath delivered thereof may soone determine.

Totocka Americana sive Amygdala Peruana Clusii forte. The Indian fruitfull Gourd bearing Almond, or the Indian Almonds of *Clusius*.



Many other fruites, as well Melon like as Gourde like and others, are used by the Indians and the Christians likewise living there among them in some sort, but these here mentioned are the choisest and chiefest of them; I will now therefore lastly shew you sundry other sorts of fruits of trees that have medecinall qualities for the most part in them, and so finish this worke.

CHAP. CXIII.

Pinei nuclei Maluccani. Malucca Pine Kernells.

SOme Orchards in *Malabar* as well as the wild woods doe nourse up a certaine tree growing to the bignesse of a Peare tree, whose leaves are soft and tender, of a darke greene on the upper side and pale underneath, tasting very sharpe and biting upon the tongue for a good while, the fruite is of the bignesse of a Filberd and triangular, divided on the inside into sundry partitions, containing within them small white hard kernells, like unto the kernells of Pine apples, whereupon they have so called them, and which the Indians use as well in the cure of diseases, as to performe their wicked desines: they use to give two of these kernells, the skins that cover them being first taken away mixed up in a glister, to purge and procure ease to those that have the Sciatica or hip gout, & in the broth of a Chicken to those that have their urine stopped or make it with paine, and to cause tough, thicke and cold humours to be avoyded: they give them likewise to those that are short winded or have a cough, for which they much commend them, and often use them being dissolved in water, and the face or other parts of the body annointed therewith doth give helpe and heale Tetters, Ringwormes and Scabbes, being a little rubbed before the using, for they are caustick or burning as experience sheweth: Wicked women and harlots give foure graines or kernells of them to their husbands or others thereby to kill them: those of *Canara* doe call them *Gepala*, and are in frequent use with the Indians where they grow plentifully for purgations:

Pinei Nuclei Maluccani. Malucca Pine Kernels.

Monardus maketh mention of another kinde of purging Pine kernells, growing in *Hiſpaniola, &c.* within such like cones but greater and longer, thinner ſheld and blacker then the uſuall ſort, whoſe kernells being white and ſweete, tempt divers to eate of them without ſuſpition of evacuation, yet five or ſix according to the ability of the patient, being given in wine doe purge ſtrongly both upwards and downewards, avoyding groſſe humours eſpecially; but being a little terrefied at the fire they worke not ſo violently or with ſuch torments and gripings:

Lux let pinei alij.

CHAP. CXIIII.

Penoabſon. The Apple bearing poyſonous Almond tree.

THevet ſheweth in his deſcription of *America*, that in ſome parts thereof there groweth a tree, the barke whereof is of a ſtrange and mervailous ſent, having leaves like unto Purſlane, very thick and alwayes greene: it beareth fruite as great as large ſiſed Apples, and as round as an hand-ball which are not to be eaten for they are poyſon: but they containe within them ſix other fruits, very like unto Almonds but flatter and broader, each lying in a ſeverall cell, which are wonderfull profitable to the people, to heale their wounds by darts or otherwiſe in their warres, for out of theſe fruits they preſſe a kind of red oyle with which they are quickly cured.

CHAP. CXV.

Cacao ſive Cacavate. The Peare bearing wholſome Almond tree.

BEnzo in his deſcription of *America*, remembreth a tree growing in *Nicarragne* a Provincē of thē Weſt Indies ſomewhat like unto the laſt deſcribed, but becauſe it is another ſort you ſhall have the relation thereof as he ſetteth it downe. It is the fruite of a meane ſiſed tree growing onely in warme and wet yet ſhadowed places, and therefore muſt be defended from the ſight of the Sunne by having a tall tree planted to the Sunne ward of it, which muſt be fitted and plaſhed that it may be as an Arbor unto it, or elſe it will wither and periſh: the fruite doth ſomewhat nearely in forme reſemble a Peare, or Peare faſhioned Gourd, with a thicke ſhell or rinde, and within lyeth an Almond like fruite, halfe as big againe as a Walnut, incloſed in a hard round ſhell, the kernell being blackiſh without, and browniſh aſhcoloured veines within, but bitteriſh and unpleaſant, yet very ſweete and pleaſant to the Indians. After they have gathered the fruite they breake the outer rinde and lay the inner fruite upon Mats to dry in the Sunne, untill the moiſture within them be conſumed, and then they keepe them both for their meate and merchandiſe, for ſhippes loaden with them are carried from *Gnatimale* to new *Spaine*, and other places thereabours, and trucke with them for other commodities in ſtead of mony, and give of them to the poore in ſtead of an almes. A drinke likewiſe the Indians make thereof called *Chocolate*, well pleaſing and accepted with the greateſt among them, who account nothing of more eſteeme; but to the Chriſtians, at the firſt it ſeemeth a waſh fitter for hogs, yet by uſe even accepted by them alſo in the want of better.

Cacao ſive Cacavate.
The Peare bearing wholſome Almond tree.

CHAP. CXVI.

Areca ſive Fauſel ſeu Avellana Indiana verſicolor. The diſcoloured ſmall Indian Nut.

THis tree groweth great and very tall, but the wood thereof is ſpongy and not eaſie to breake, without any branches unto a great height, and towards the toppe ſpreading many faire branches, and leaves thereon greater and longer then the Coker Nut tree, the flowers are white without ſent, and grow many together on a long ſtalke hanging downewards from the lower branches, the fruit following on every one, being longer but ſmaller then the Nutmeg with all the outer rindes and ſhells, and hath the outer rinde covered with a yellow Cotton like ſilke, the inner kernell being very like unto a Nutmeg, ſomewhat round, and ſmall at one end and flat at the other, with the like diſcoloured veines therein, but without any heate in taſte or ſent, and is therefore held to be cooling and drying: it groweth in ſundry places of the Indies more or leſſe plentifull in one or another place, and chiefly neare the Sea coaſts: With the twigs hereof that are of two fingers thickneſſe the Natives uſe to hunt the Crocodils as well in the water as on land, for if they can thruſt theſe ſtickes into their mouthes they are ſure they cannot breake them, becauſe they are ſo lithye and ſpongy, and thereby they doe retaine and take them, it is called *Fauſel* by the *Arabians*, but ſome falſly *Filfel*, by the chiefeſt Indians *Areca*, by thoſe of *Gazarate*, and *Decan Supari*, in *Malabar Pac*, in *Malaca Pinan*, in *Couchin Chacani*: it is profitably uſed in all hot diſeaſes, to helpe the tooth ach, and to faſten looſe teeth in the head or the looſe gummes: the Indians uſe this fruite abundantly eyther unripe to ſtupefie their ſenſes like to drunkenneſſe, or ripe, being mixed with the leaves of Betell or

Betre

Arecavel Fausel sive Avellana Indiana versicolor.
The discoloured small Indian Nut.

Nux Fauselcum suo in volucro et eodem exempto.

Betre, the ribbes therein being first taken away, some put sundry other things to them, as *Lycium*, *Camphire*, *Lignum Aloes* and Ambegrise according to their qualities that take delight in it, which is generally through all the countries of India, with the chiefe persons most, and with the inferiour in some sort also. *Garcias* saith he distilled a water from them being fresh, which he used with good successe in all hot or chollericke fluxes of the belly.

Arecæ sive Avellanæ Indicæ versicoloris genus oblongum Clusij.
A kind of small long discovered Indian Nut of *Clusius*.

Clusius in his *scholia* upon the *Fanfel* of *Garcias* exhibiteth another kind of *Areca* or *Fanfel*, whose kernells hath discoloured veines therein like a Nutmeg, or the former sort, and with a blacke covering over it, the chiefest difference from the other consisting in being longer then the other. *Lobel* supposeth it may be the kernell of a nut of his *Palma Pinus*.

Linschoten also saith that there is another sort of *Areca* which is smaller, blacker and harder then the former, and called by the Natives *Checaninas*, which causeth a lightnesse in the head.

Clusius also relateth of another as large as a Walnut, with the outer greene rinde, but the shell was hard and smooth of a Chesnut colour, long and pointed at both ends, flat on the one side and bunching out on the other, the kernell within being white and sweete. Another was about a finger long, and as thicke as two, flattish on the lower end, and of a rugged ash colour, the upper end being smooth and of a browniſh colour, seeming like some small ticke, covered with a thicke hard shell, having a kernell within it.

Arecæ sive Avellanæ Indicæ versicoloris genus oblongum Clusij:
A kind of long small Indian discoloured Nut.

Divers other fruits are mentioned by *Clusius* and many others wee have seene our selves, but becanse wee doe not know any use of them or propertie in them, I rather forbeare their relating, then stuffe the worke with unprofitable matter, it being growne so voluminous already.

CHAP. CXVII.

Arbor Braſilia. The Braſſill tree.

THe tree that beareth the Braſſill wood which ſerveth the Dyers uſe, and to make Inke is a goodly faire great tree growing in divers places of the countrey of *Braſſill*, and in no other place as it is thought, and the chiefeſt about *Fernambuck* from whence have riſen the appellations to the weod: the leaves wherewith it is cloathed are as ſmall as Box leaves, thicke and evergreene like them, the barke is of an aſh colour, and the wood red, eſpecially the core or heart thereof which is the beſt, and as it is ſaid is no bigger then a mans heigh, though the tree be ſo bigge in compaſſe that three men cannot fathome it. This as it is ſaid alſo beareth neither fruit nor gum, but I wonder then how ſo many could be found growing there? could the earth of it ſelfe thinke you without ſeede bring forth that abundance? or will not time conſume them all? ſurely it cannot be but that it beareth ſeede, and is thereby propagated although not obſerved, &c.

Arbor Braſilia. The Braſſill tree.

CHAP. CXVIII.

Arbor Triſtis. The ſorrowfull tree.

THe tree that beareth this name from the properties riſeth to be a reaſonable tall, ſpreading ſundry ſlender branches and faire leaves ſet by couples on them, very like unto the large or great Myrtle leaves and ſmaller then thoſe of the Plum tree, little or nothing ſnipt about the edges, a little rough, and greene on the upper ſide and gray underneath: at each joynt with the leaves towards the ends of the branches on both ſides come forth ſlender reddiſh yellow footſtalkes wherewith they colour their broths and meates yellow like Saffron, bearing three or foure, or more flowers together thereon, compoſed of ſundry ſmall white leaves pointed at the ends, making a double flower, with divers ſmall threds in the middle, ſmelling ſo ſweet that they are thought to exceede eyther the Orrange or *Iaſmine* flowers, whoſe propertie is never to blow open in the day time, but in the night onely (when its time of flowring is) for ſo ſoone as the Sunne ſhineth thereon in the morning, they all for the moſt part fall downe under the tree, and the whole tree with the branches ſeeme as withered and dead untill the evening, eyther through the tenderneſſe of the ſtalke, or by a naturall antipathy unto the Sunne, not to abide the ſhining face thereof, for ſome of the flowers doe abide on theſe branches that are moſt ſhadowed from the Sunne: the following fruite they give is flat ſomewhat like a Lupine with a thicke skinne, (it muſt be but ſmall ſtore, for what quantitie of fruite can this tree beare if all or the moſt of the flowers doe fall away) yet heart faſhion, and of a greeniſh aſh colour, with a diviſion in the middle, in each part whereof is contained ſmall flat beanes or kernells, like unto thoſe of the ſweet beane or Carob tree, heart faſhion likewiſe, and covered with a greeniſh skinne or peeling, the inner kernell being white and ſomewhat bitter. This tree hath been much deſired to be tranſplanted into our Chriſtian world, but as ſome have ſayd it would not abide, notwithſtanding all the care of earthen and woodden veſſells, wherein it was planted to be

Arbor Triſtis. The ſorrowfull tree.

brought

brought into *Spaine* or *Portugall*, neither ever would the seede spring as it is affirmed, but I have lately understood by a catalogue of the Plants growing in the garden of *Signor Corvino* of *Rome* that it groweth there, being one of the plants named therein. It plentifully groweth in *Malabar* and brought thence to *Goa*, and sundry other places of the *Indies*, where every branch being put into the ground will take roote and grow. It is called in *Malabar Mogli*, in *Malayo Singadi*, in *Decan Pul*, of the *Arabians Guart*, of the *Persians* and *Turkes Gul*, but at *Goa* and *Canarin Parizataco* from a certaine Nobleman so called (as the Natives thinke and therein very neare intimating one of *Ovids* fabulous metamorphosis) whose faire daughter the Sun having espyed fell in love withall, and having deflowred her & forsaken, for another, she slew her selfe; from whose ashes of her burnt carkasse rose up this tree, which is ever since ashamed to behold the face of the Sunne. In many places of the *Indies* they distill the flowers for their sweet sent sake, and keepe it for use; which in *Malabar* they call the water of *Mogli* after the trees name: the said water is good for sore eyes to coole their heate and redneſſe, if linnen cloathes being dipped therein be layd upon them: the Indian Phisitions doe hold opinion that both flowers and fruite doe comfort the heart, and refresh the fainting spirits thereof, for they have some bitternesse in them, it hath not beene observed that the Indians apply this tree to any other use then is formerly expressed, and the colouring of their meates like as Saffron is used for the same purpose in *Spaine* and other countries.

CHAP. CXIX.

Arbor foliis ambulantibus. Walking leaves.

NEare unto the Ile of *Cimbubon* and in the Ile it selfe, there groweth a tree bearing leaves like unto those of the Mulberry tree, having two small short and prickly feete as it were set on eyther side of them, which falling to the ground doe seeme as it were to creepe as if it were some living creature, and being touched by any will presently move it selfe. Master *Anthony Pigafetta* saith that he kept one of these leaves in a continuall motion in a platter for eight dayes (the motion whereof is likely to come by the ayre) and then it ceased.

CHAP. CXX.

Arbor aquam fundens. The fountaine tree of water.

IN one of the Ilands of the *Canaries* called *Ferro*, there groweth a reasonable great but faire spread tree bearing leaves like unto Wallnut tree leaves but larger, abiding thereon and ever greene: it beareth fruite like unto an Ackorne hanging downe from the branches, which hath a kernell within of a very pleasant taste and almost like spice. In some parts of the world besides are found the like trees, the leaves whereof and branches doe perpetually droppe water (in the whole Iland there being no other water to be had) a thicke mist as it were or cloud encompassing it continually, except when the Sunne shineth bright thereon; which water being kept as it were in a fountaine made for the purpose to retaine it, serveth the whole Iland for their use. Our Countrey man Master *Lewis Iackson* dwelling in *Holburne*, told Master *Purchas* as he hath set it downe in his seventh booke of Pilgrimages Fol. 1639. that in the yeare 1618. he had beene in the said Iland *Ferro*, and had seene that tree, and saith it is as bigge as an Oake of a middle size, the barke white like Hardbeame, six or seven yards high with ragged boughes, the leafe like that of the Bay, white underneath and green above: it beareth neither fruit nor flower: thus saith he, but it hath some other different relations which who so would see, let them reade the place before recited: the Ilanders call this tree *Garoe*, the *Spaniards Arbor Sancta*: but the ancient Historians call it *Tile*. It is thought that *Solinus* and *Pliny* in his *lib 6. c. 32.* meant this Iland under the name of *Ombrion* and *Pluvialis*, for hee there saith that in the Iland *Ombrion* grow trees like unto *Ferula*, from whence water is wrunge out, from the blacke ones commeth bitter water and from the white that which is sweete and pleasant to drinke.

I might here insert the Barnacle tree but that it is found to be a fable, and that the Geese hatch their young as other Birds and fowles doe, and therefore I forbeare to speake of it.

Arbor aquam fundens. The fountaine tree of water.

Arbor anatifera. The Barnacle tree of the Goose.

CHAP. CXXI.

Quercus natalitijs Divirens. The Christtide greene Oake.

IN the new Forrest in *Hampshiere* neare a place called the Castle of *Malwood* groweth an old great doating Oake, which by the relation of the neare Villagers, is alwayes observed to shoot forth fresh but small greene leaves every yeare a little before Christide, which abide not long thereon after that time, but fall away, others springing out in the due time that other Oakes doe, bearing both leaves and fruit as usually other Oakes doe in their season. King *Iames* in his time understanding of this tree, went and saw it, and caused it to be paled about and benches made thereat, both for people to sit and contemplate the wondrous workes of God therein, and to keepe unruly persons from breaking and spoyling it: but (*nitimur invetitum semper*) the more it was intended to be preserved, the more wilfull people were bent to breake and spoyle it (being the more famoused by that provision) and breake downe the pales and carry them away. I have had both leaves and Ackornes brought me from this tree, taken by Master *John Goodier* each in their season.

CHAP. CXXII.

Arbor Venereos stimulos domans. The Chaste making tree.

PEtrus de Osina in his letter to *Monardus* maketh mention of a certaine tree growing there in the West Indies whose timber was of a spongie substance whereof the Indians would never take a sticke to burne, neither by any meanes, although they were treatned to death could be brought to burne it or abide where it was burned, for they said that whosoever came neare the fire or flame thereof, or whomsoever the smoake onely touched, was made utterly impotent and unabled to any venereous acts.

CHAP. CXXIII.

Arbor Farinifera. The Bread tree.

SOme that accompanied Sir *Francis Drake* in compassing the whole world did relate that in the Iland of *Ternate*, which is neare the Equinoctiall line, towards the North pole groweth a strange kinde of tree about ten foot high, whose toppe is formed like unto a Cabbidge, in the middle whereof is found a fine white meale which the poore Ilanders gather, and by putting a little water thereto and letting it ferment they make past or dough, whereof they make thinne flat square Cakes, and bake them in certain long earthen pans, with fire put round about them which they eate while they are hot, for when they are growne older and hard, they steepe them in warme water, and bring them to a kinde of pultage and so eate them, but this Cake or bread is in a manner without taste or relliſh, but when some Pepper or Cinamon with Sugar is put thereto, it is a pleasant food to many, but *Marcus Polus Venetus* recordeth a more strange bread tree growing in the kingdome of *Fanfur*, whose trunke two men could scarse sadome, the barke whereof being thicke, and taken away, the wood thereof about three inches thicke in compasse is as hard as Iron being so heavy tha it sinketh instantly in water, whereof the natives make them short pikes or speares sharpening and burning them at the end, so that they will be able to pearce Armour: but the whole middle of this tree is soft like unto a meale, which putting in water and stirring it to take away all the drosse that swimmeth above, they mould up the residence into cakes, and divers other sorts of viands fit to be eaten, and whereof as hee saith he brought some with him to *Venice*.

Arbor vasta farinifera.

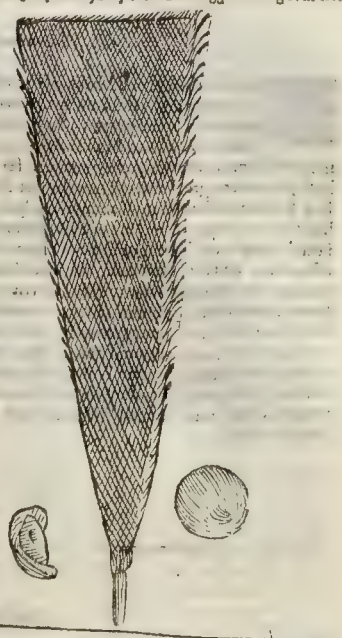
CHAP. CXXIIII.

Arbor sive Palma saccifera.
The Bagge bearing Nut tree.

CErtaine *Dutch* Marriners having by a casualtie lost their shippe, wherein they with others were saying to the West Indies, in their returne home, in their shippe boate lighted on a desart Iland called *Coronopez*, wherein they found whole woods full of these kindes of strange trees, and others growing among them whose fruits being round Nuts, as bigge as Wallnuts with their greene outer shell, and within them other smaller Nuts so round as a ball, and with so hard a shell, yet not very thicke that they could hardly be broken with an Iron hammer, and a white hollow kernell in the middle tasting

tasting like Peaſe at the firſt, but a little bitter afterwards, like a Lupine, were incloſed in a long ſheathe or hollow hoſe, reſembling an *Hipocras* or Syrupe bagge, ſome being twenty two inches long, others two foot and a halfe long, yet all being very ſmall at the end and growing larger up to the toppe, where they were about ſeven inches wide, and compoſed of a number of browniſh threds or haires diſperſed all over the caſe, ſome running at the length and ſome croſſewiſe by a wonderfull worke of nature.

Arbor ſivepalma ſaccifera. The bagge bearing Nut tree.



CHAP. CXXV.

Arbor metroſideros. The Iron hearted tree.

SCaliger maketh mention of a certaine ſmall tree, is reported to grow in the Ile of *Iava major*, whoſe heart or core is as impenitrable as Iron, from the bottome to the toppe: and the fruit which it beareth is likewiſe as hard, but the report ſaith he, is of ſo little credit and ſo neare a falſitie, as I am from beleeving it: yet *Nicholaus Coſtinus* in his Iournall doth report the ſame thing.

CHAP. CXXVI.

Arbor Gebuph. The Splene tree of *Sumatra.*

IN the Ile of *Sumatra* anciently called *Trapobana* or *Taprobana* as *Thevet* relateth it, groweth a tree not very great, called there *Gebuph*, and in the Indies *Cobbam*, whoſe leaves are many ſmal ones ſet on a rib together, ſomewhat like unto the Caſſia *ſolutiva*, or purging Caſſia leaves, ſet on ſhort branches covered with a yellowiſh barke: the fruit is ſomewhat thicke and as round as a ball, where under is contained a Nut as big as an haſel Nut, with a very bitter kernel within it, yet taſting like an Angellica roote; they uſe the fruit to quench thirſt: but the bitter kernell is the moſt effectuall in the diſeaſes of the Liver and Spleene, wherewith they are much afflicted, and therefore draw an oyle out of the kernells of the Nuts, which they take for eight dayes together, in which time the diſeaſe is much abated and quickly after cured: thoſe that cannot by reaſon of the bitterneſſe take it ſo willingly, as women and children, it is appointed unto them to be annointed with the oyle on the belly, back bone and ſides, which worketh the cure alike: the ſaid oyle is in much uſe with them alſo, and of great account for the ſingular helpe and remedy it giveth to all joynt aches, gouts and the like: the gum likewiſe of this tree being diſſolved with a little oyle and ſpread plaſterwiſe is applyed to the grieved places with good effect. The inhabitants doe plant this tree neare their Houſes in their Orchards and Gardens for to have the benefit thereof nigh at hand.

Arbor Gebuph. The Splene tree of *Sumatra.*

CHAP. CXXVII.

Beretinus fructus. The Beretine Ackorne.

Clusius in his second booke of Exoticks and seventeenth Chapter, maketh mention that he obtained some of these fruites, from those that accompanied Sir *Francis Drake* in his Circumnavigation of the world, returning in the yeare 1580. by the meanes of some of his friends here, as Master *Garth* and Master *Morgan*, which were affirmed to be gathered in some Islands (whereinto they put both for fruit and victuall standing in neede of both) from very great and tall trees bigger then Oakes, whose leaves were like unto Bay leaves, not dented at all about the edges but thicke and shining: the fruit were like the Ackornes of the Ilex or evergreene Oake, but without any cup, for as hee saith he enquired thereof of some of them, whose outer rinde was thinne and of an ashcolour, and some blackish, the inner kernell being somewhat long and white, without any manifest taste within but covered with a thinne skinne, which they found good to be eaten without any harme following, and therefore in their want being taught by the Ilanders they boyled them like Pulse or Pease, and so eate them, or beate them to pouther and boiled them like Rice or Wheat, untill it became a pultage and so eate them for hunger: yet afterwards they found the like trees and fruit to grow in the Islands of the *Moluccas* as they affirmed: But with what other propertie they were indued, neyther they nor any other hath manifested to any that I know.

Beretinus fructus.
The Beretine Acorne.

CHAP. CXXVIII.

Vhebebasou. The Indian Hony tree.

Hevet maketh mention of this tree among his other *American* singularities to be very tall, spreading the branches so uniformely, that it is a great pleasure to behold, in that they seeme so disposed by art and not by nature, having leaves on them like to Coleworts, (which I beleeve is mistaken, the figure not expressing such a forme) and fruit of a foot long. In the hollow parts of this tree above other, the Bees doe make their Hony and Wax, whereof the naturalls make much account, for with it they season their foode made of roots, &c. Vnto this tree resorteth familiarly a certaine beast somewhat like a Cat, but of a browne colour, called by them *Heyrat* that is the Hony beast to feed on the honey, which it carefully pulleth out with the feete without hurting the Bees or being stung or hurt by them.

Vhebebasou. The Indian Hony tree.

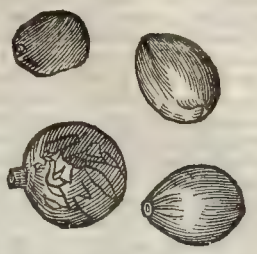
CHAP

CHAP. CXXIX.

Pruna insana quæ Nuces insanæ a Clusio dicuntur. Mad Indian Plums or Nuts.

THis Indian fruit mentioned by *Clusius* in second booke of Exoticks, page 53. and 54. is thus related by him. The *Dutch* after much wandring in the unknowne Seas fell by chance into a certaine Bay, scituate in 11. degrees 45. minuts of Northerly Latitude where they found certaine trees as big as Cherry trees, with long and narrow leaves like Peach leaves, whose fruits they saw the Monkies there eating, whereupon divers of them gathered some and eate them, which were fully round, growing for the most part singly each upon its stalke, and sometimes two together, being about two inches or not much more either longwise or round, with a firme but not very thicke shell, brownish on the outside and not very smooth, but smooth within, and of a brighter colour, containing a certaine fruit within somewhat like unto a blacke Sloe, both for forme and size, spotted with somewhat a large white spot at the bottome where it stood upon the stalke, having a stone under that Plum which was grayish and hard, and a kernell with it, those persons which had eaten of these Plums felt no harme, but some of the company steeping both stones and kernells, and boyling and eating of them fell into divers distemperatures, according to each mans severall humour, one thought his Cabin was made a Brewhouse, and bad take away the woman that was there: another called his Mates together, asking them if they would buy his fish, whereof he had varieties; another lying in his Cabin complained that his flesh was torne from his bones, another cryed out loudly that they were building a great ship in his Cabin, another in his Cabin broke foure or five *Chinay* dishes, saying that many men were comming to take away his Cabin from him, another calling to the Maister of the shippe said, doe yee not see the Divell sitting in the Sterne catching Fish; another sayd that he saw the Anchors in the bottome of the Sea through the bulke of the Shippe; the Masters sonne said to his father, O my father I see a number of little men running upon your nose, but after they had slept all these imaginations vanished, yet some of them slept for a day and a halfe, and some two whole dayes before they waked, and some thereby were troubled with the laske: many other fancies fell among the rest which were too long to recite; but among them all saith he as it were in scorne among the rest there was an English man distracted, who looking upward said he saw the heavens open and cryed with a loud voyce, O Lord I will willingly follow thee, and with divers other gestures moved the company to laughter. *Clusius* sheweth that in the same table with these Plums or Nuts hee set another small Nut not much unlike an Hasell nut which made no noyse of any kernell therein, and knew not whether it had any cup to hold it as an Acknorne hath or no.

Pruna insana quæ Nuces insanæ a Clusio dicuntur.
Indian Plums or Nuts.



CHAP. CXXX.

Mamoera mas & fœmina.
The male and female Dugge tree.

THe forme of these two sorts of tres are both alike, not differing the one from the other, but in this that the male beareth no blossomes, but fruite like unto a small Pompion many growing together towards the toppe out of the body of the tree which hath no armes or branches but onely large broad leaves much like unto the Plane tree or Maple tree leafe, each standing on a very long stalke: the trunke or stocke of the tree is neare two foot thicke, and about nine foote high: the flowers are of a pale yellow colour like unto Elder blossomes which serve to no use, the fruit is round and fleshy, yellowish when it is ripe, and serving them to loosen the belly when they are eaten and conteine within them many round blacke shining graines as bigge as Pease which likewise are put to no use with them. The propertie of these trees is said to be, that unlesse the male kinde bee planted to grow neare the female it will beare no fruit at all; of which nature a kinde of Date tree is said to be also. This tree groweth in that part of *Brasill* that the *Portugalls* called *Baya de todos los Sanctos.*

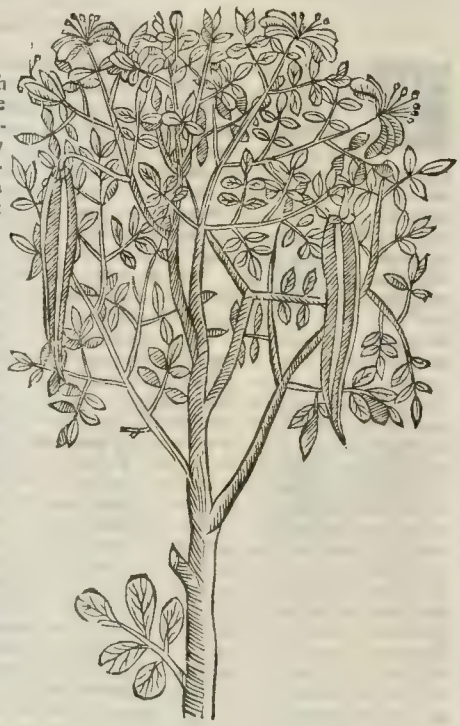
CHAP. CXXXI.

Moringa. The Bezar tree.



Moringa. The Bezar tree.

THis tree groweth not great, nor ſpreadeth with many branches, but is like unto the Lentiske or Maſticke tree both for greatneſſe and leaves, being full of knots, very eaſie to be broken, of a very faire but ſad greene colour and of the taſte of Turnip leaves: the fruit is a foot long, and of the bigneſſe of a Reddiſh root having eight edges or corners of a greeniſh aſhcolour with a white ſubſtance within devided into certaine cells wherein lye ſmall round ſeede like unto ſmall Peaſe but greene and tender, and of a ſharper taſte then the leaves: the whole fruit ſliced in peeces is boyled in the broth of fleſh and ſundry other wayes. But the roote of this tree is a ſoveraigne Antidote or Counterpoiſon, as effectuall as Vnicornes horne or Bezar ſtone or any Treakle, for the natives doe uſually take thereof, both againſt all kindes of poiſons and the bitings of the moſt venomous creatures, yea even that ſerpent which the *Portugalls* call *Culebras de capillo*, which is accounted the moſt dangerous of all, taking thereof both inwardly and applying it to the outward place. They have found it alſo to bee ſingular good againſt the winde chollick, and to be no leſſe effectuall againſt the Leproſie, for many have beene thereof cured by often uſing of it, it is mixed alſo with thoſe medecines that purge melancholy. It groweth plentifully in all the Province of *Malabar*, where they bring the fruit into the market to ſell as beanes and peaſe or elſewhere. The *Arabians* and *Turkes* call it *Morian*, the *Perſians Tame*, but they of *Gazurate Turiaa*.

CHAP. CXXXII.

Negundo mas & famina.
The male and female wound tree.

Negundo mas. The Male wound tree of the *Portugals*.

THe Indians make two ſorts hereof, the one they call *Varolo Nigundo*, that is, the male, and the other *Niergundo* the female, in *Malabar Noche*, in *Balagate Sambali*, in *Decan Beche*, and ſo alſo by the *Perſians* and *Arabians*, but *Ait* by the *Turkes*, and *Norcila* by the *Portugalls*: theſe trees are of much eſteeme in the province of *Malabar*, and of ſo frequent uſe with all ſorts of people, for all their griefes and diſeaſes, that if they were not great increaſers, and that every branch thruſt into the ground will take roote and grow, they had beene wholly conſumed or growne ſo ſcarſe that they would have beene at an exceeding great price. The male groweth like the Almond tree with rough leaves like unto Sage, greene above and hoary underneath, and dented about the edges, ſomewhat reſembling Elder leaves a farre of. The female kind groweth greater and hath larger and rounder leaves, reſembling thoſe of the white Poplar tree and not dented about the edges: the leaves of both ſorts ſmell and taſte like Sage, but yet are more ſharpe and bitter, many of them having a white froth on the backſide of them, comming on them in the night: the flowers of both are of a pale blew or aſhcolour much like unto thoſe of Roſemary: the fruit of both likewiſe is like unto blacke Pepper but nothing ſo ſharpe and hot as Pepper comming nearer unto the taſte of Ginger. Both leaves flowers and fruit bruiſed and boyled in water or oyle are uſually applyed to

all

all diſeaſes by the vulgar ſort, but eſpecially to all ſoynt aches, tumours and contuſions proceeding from any hot cauſe, and that with ſingular good effect: the leaves alſo bruiſed and laid upon old Vlcers doth wondrouſly helpe to digeſt the matter, cleanſe them and bring them to cicatriſing, ſo as the body be not foule but prepared and purged before hand. And certainly they are found ſo available in all wounds, Impoſtumes and bruiſes, that the people uſing theſe, ſeeke for no Chirurgian. The women uſe to waſh their whole bodies with the decoction of theſe leaves at all times and ſeaſons, and are ſo perſwaded of their effect to helpe them to conceive children, that they that ſhould goe about to perſwade them the contrary, they would ſtone them to death.

CHAP. CXXXIII.

Nimbo. Another healing or wound tree.

THis other tree is more rare and ſcarſe then the laſt, called by thoſe of the countries in *India* where it is knowne *Nimbo*, but by thoſe of *Malabar Bepole*, and is of much account both with the Chriſtians there and Gentiles. It is as bigge as an Aſh, whereunto a farre off it is very like, the leaves are very greene on both ſides, dented about the edges and pointed at the ends, it is plentifully ſtored with both leaves and flowers which are ſmall and white, with five leaves apeece and ſome yellow threads in the middle, and of the ſmell of the *Trifolium odoratum*, ſweet Trefoile, after which the fruit appeareth which are like unto ſmall Ollives with a yellow thin skinne. The leaves are ſomewhat bitter, but very wholeſome being bruiſed and mixed with a little juice of Lemons, & dropped into foule Vlcers or thoſe that are hollow or fiſtulous, or with hard skins therein eyther of man or beaſt, doth helpe them by digeſting, clenſing, healing and skinning them: the juice of the leaves is a moſt familiar and knowne remedy in *Malabar* to kill the wormes of all ſorts in the body, whereunto they are much ſubject, whether taken alone or with other things for the purpoſe into the body, or uſed outwardly to the Navell: the flowers & fruit alſo are much uſed againſt the gout and the paines, ſwellings, weakeneſſe and Impoſtumations of the joynts or parts, the Oyle likewiſe preſſed out of the fruit is ſingular good in the paines and greefes of the ſinewes, and therewith doe thoſe of *Malabar* cure both wounds in the fleſh, punctures and pricking of the Nerves and Sinewes, and contractions or diſtortions of the members.

Nimbo. Another healing or wound tree.

CHAP. CXXXIIII.

Hyvourabe. The *Americans* vice Guajacum.

THis tree is very tall having a barke of a whitiſh ſilverlike colour, but the wood is reddiſh under it of a little brackiſh or ſalt ſweet taſte, reſembling the wooddy part of *Licoris*: it beareth fruite of the bigneſſe of a meane Plum, and of a good yellow colour, with a kernell within it, of a moſt ſweet and delicate taſte: but which maketh it the more wonderfull, ſo ſeldome bearing fruit that as it is ſaid, a man in his life time ſhall ſcarſe ſee the fruit above foure or five times on the tree, being fifteene yeares betweene one and the others bearing. The barke of this tree is of a wonderfull vertue, and effect in curing the Indian (which we call the *French*) diſeaſe and is of the ſame account with the Indians where it groweth that Guajacum is with us, and while it is freſh cut or peeled from the tree giveth a white milke, this barke being cut in ſlices, they boyle in water three or foure houres untill it become of a Claret wine colour, which decoction they drinke for fifteene or twentie dayes together, uſing in the meane time a ſpare diet, by which meanes they are not onely cured of that diſeaſe but of any other that proceedeth of cold and flegmaticke humours: the kernell of the fruit is much uſed by the ſick whoſe appetite is loſt to quicken it and get it againe. Neare all the coaſts of the continent ſaith *Monardus*, is gathered by the *Indians* a certaine white liquor like milke taken from the branches, and ſmall Apple like trees being wounded, which they call *Pinipinichi*, which ſoone groweth thicke, and is ſomewhat clammy, three or foure drops whereof being taken purgeth very violently, being taken in wine: but if any finde it to worke above their ſtrength or deſire, by taking eyther a little broth, wine or other drinke, it ſtayeth the working preſently.

Lac Pinipinichi.

CHAP. CXXXV.

Achanaca Theveti. The blacke Moores Guajacum.

THe *Ethiopians* on both ſides of the River *Senaga*, neare unto *Cape verd* as *Thevet* ſaith, doe abound with the Venereous diſeaſe, which holdeth them chiefly in the privie members which in men is called *Aſab*, in women *Aſabates*, the diſeaſe it ſelfe *Boroxeil* or *Zail*: but by the skill of the Phiſitions of whom they have many, and skilfull in their profeſſion called *Biarins*, they have found out growing with them an herbe of aſſured helpe and remedy therefore, which groweth up with a great ſtalke as bigge as a mans legge, and many great leaves thereon, cut in or jagged on both edges, ſomewhat reſembling a Colewort leafe, but nothing ſo thicke eyther in the leafe or middle ribbe and double pointed at the end, from among whom groweth the fruit, of the bigneſſe of an egge, and of a yellow colour, which they call *Alfard*, the decoction of this herbe above all others, although they uſe divers, is of ſufficient validitie to cure it, for they have no other Guajacum for their helpe, and therefore uſe this in ſtead thereof.

Achanaca Theveti. The *Ethiopian* vice Guajacum.

CHAP. CXXXVI.

Winteranus cortex. Captaine *Winters* Cinamon.

CAptaine *William Winter* that in a ſhippe by himſelfe accompanied Sir *Francis Drake* in part of his voyage over the whole world, but left him at the *Straights* of *Nagellon* returning from thence home into *England* againe in the yeare 1579. in the parts thereabouts cut downe certaine trees, whoſe barke was ſomewhat like unto the thicker ſort of Cinamon, both for ſubſtance and colour, yet for the moſt part thicker, and ſome of it of an aſh colour, and ſome browniſh on the outſide and rugged like Elme barke, ſome of it having chinkes or riftes on the inſide, and ſome ſmooth and firme, of a ſmell not unpleaſant, but of a very ſharpe taſte like many ſpices together, heating the mouth more then Pepper; the leafe of the tree is of a whitiſh greene, not unlike the Aſpen leafe, the berries grow in cluſters like the Hawthorne, with divers ſeedes in each of them. They at the firſt knew not of any properties therein, and therefore boyled ſome of it in hony, to make it the more pleaſant to be taken, and dryed other ſome and made it into pouther, putting it in ſtead of Cinamon in their meats: but afterwards they found it to be ſingular good againſt the Scurvey, for divers in the ſhippe being troubled with that diſeaſe found remedy thereby in uſing it a while. Some of our company of Apothecaries, and thoſe not of the meaneſt doe uſe to call the *Canella alba* mentioned here before *Cortex Winteranus*, and have uſed it in their diſpenſation of *Mithridatium* as a ſubſtitute for *Coſtus*, whereof I gave you a touch in the Claſſis of *Cardui* and *Spinoſa*, in the laſt Chapter thereof ſave one, but now by comparing the one with the other you may eaſily ſee the errour, for the *Canella alba* is a white barke, rowled like Cinamon, and not much thicker then it,

Winteranus Cortex. Captaine *Winters* Cinamon.

of

of an hot taſte but neither like Cinamon nor Pepper, and this *Cortex Winteranus* is thicker then the thickeſt Cinamon, not caſte into rowles or hollow pipes like it, and taſting much quicker, beſides the colour is of a duskie browne in moſt, comming neareſt unto Cinamon, I thought good a little to explaine this matter here, becauſe I finde many poſſeſſed ſo ſtrongly with that errour that *Canella alba* is *Cortex Winterani*, that all may ſee how true their opinion is. This barke might ſeeme to be that whereof *Monardus* ſaith he had a peece from *Bernardino de Burgo* an Apothecary, but that his had a more excellent ſmell and taſte, excelling that of the Nutmeg, and as pleaſant as Cinamon, and more cordiall, which is not found in this barke of *Winters*, *Monardus* likewiſe maketh mention of another thicke barke which was taken from a tree as great as an Elme and like in forme, growing ſcarſe in any other part of the Weſt Indies, then neare the Rivers ſides about 25. leagues diſtant from *Lima*: it is hot ſaith he above the ſecond degree: the Indians uſe to put it up into their noſtrills, the fine pouther of the barke when they are troubled with rheumes and defluxions from the braines, or with other paines in the head, for it plentifully draweth downe humors whereby they finde eaſe.

CHAP. CXXXVII.

Coru arbor. The coſtive or binding tree.

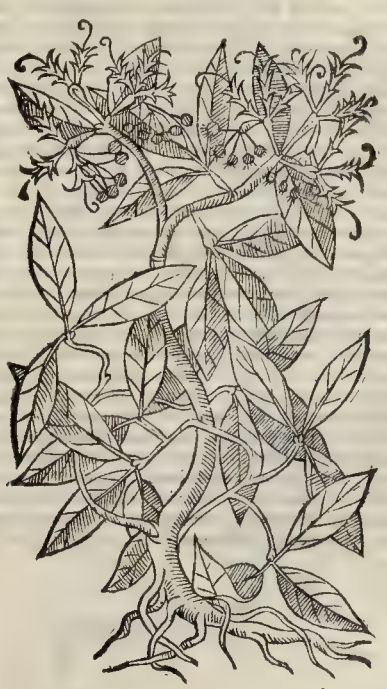
THis tree is ſomewhat like unto a dwarfe Orrenge tree both for forme and leafe, but having a thicker middle ribbe and eight or nine other ſmaller ones running to the ſides: the flower is yellow without ſent, the barke of the roote onely is in uſe which is of a pale greene colour, and being broken yeeldeth much milke, which is ſomewhat clammy, having little taſte, but ſome bitterneſſe; & is more drying then cooling. The juice or milke of the barke of the roores hereof, although unpleaſant is much uſed by the natives of *China*, *Iapan*, *Malaca* and *Bengala* as well as *Chriſtians* in all manner of Fluxes and Laskes comming from what cauſe ſoever. Thoſe of *Canarin* call it *Coru*, they of *Malabar* *Curo* and *Curo dapala*, and the *Brachmenes* *Cura*.

CHAP. CXXXVIII.

Pavate. Another Coſtive tree.

THis other tree which is more frequent to be had then the laſt, and called *Pavate* in *Malabar* is therefore in more uſe though not altogether of ſo ſtrong and ſpeedy effect, for the ſtaying of Laskes and Fluxes, but is of excellent propertie to coole all hot inflammations, and eruptions of cholericke matter in the skinne and S. *Anthonies* fire: the roote of this tree is of chiefeſt uſe, and ſometimes the wood ſteeped in the decoction of Rice, which will grow ſower after it hath ſtood a few houres, and then they call it *Cania*, with this decoction they waſh alſo the outward parts inflamed or ſpotted which cooleth much, and helpeth all thoſe heates: it is alſo drunke being ſteeped as aforeſaid againſt the heate of the Liver, and in hot Fevers: a few leaves of Tamarinds being put thereto they uſe to waſh the ſides of Vlcers and wounds that are inflamed, and have defluxions of humours to them to ſtay the Flux and coole the heate. The tree is not greater then the former, having but few branches and ſuch like leaves of the Orrenge, but without that ſmall leafe underneath it, and of a freſh greene colour: the flowers are whitiſh like unto the Hony ſuckle with ſmall round blackiſh ſeede likeunto thoſe of the Maſticke tree: the barke is of an Aſh-colour, and the root white. The *Brachmenes* and thoſe of *Canarin* call it *Vaſaveli*, the *Portugalls* *Arbol contra las viriſpolas*.

Pavate. Another Coſtive tree.



CHAP. CXXXIX.

Pacal. The Tetter tree.

THis tree groweth neare the Rivers ſides in the Weſt Indies, part whereof being ſent to *Monardus* had this commendations that the aſhes of the wood mixed with a little Sope, the Indians uſed to annoint on thoſe places that had Tetters, Ring-Wormes or the fowleſt ſpreading Vlcers, and ſcarres that could be, either in the head or any other part of the body to cure them and leave the place faire againe.

Chap. CXL.

Lignum Nephriticum. The tree against the stone.

From *Hispaniola* and the parts thereabouts hath beene often sent many yeares since as well as of late, though now in farre lesse esteeme, a certaine smooth light and white wood, the tree whereof is as bigge as a Peare tree, without knots: the Wood being sliced small and put to steepe in pure Conduit or Spring water will within halfe an houre, or thereabouts (if it be right) discolour the water into a fine light blew colour, which lying longer therein will cause it grow of a deeper colour, this infusion so made, although it be altogether insipide and without any taste as if nothing had beene put into the water, is found yet to be hot and dry in the first degree, and singular availeable against the stone in the kidneyes and the difficultie in making urine, and is found also by good experience to open the obstructions of the Liver and Spleene, the water or infusion is being drunke of it selfe, or mixed with wine and so taken: but there is another wood very like unto this, which often obtruded on many in stead thereof which, being infused in water in the like manner will discolour the water yellow, and therefore without tryall the right is hard to be discerned.

Chap. CXLI.

Lignum Molucense. The Moluceas tree against venome and poyson.

In the Ilands of the *Moluceas* is a certaine tree rather planted every where in Orchards then growing naturally being as bigge as a Quince tree, whose leaves are broad and cut into divisions, somewhat like unto those of the Mallow, the fruit is like to Hasell nuts but lesser, and with a softer and blacker shell, whereof the natives make so great account that they will scarse suffer any strangers to see it, much lesse to know any of the properties of it, which they keepe from others as secret as may be: but yet this their secresie hath caused it to be sought for and searched into nearer then otherwise peradventure it would have beene: For some *Portugalls* have found out in part by the sight of the cures the Indians performed, and partly by their relations, which by meanes they made unto them they obtained of them, and partly by their owne judgement and practise also at sundry times in the Spittles there, and in the shippes among Mariners, that the wood made into pouther and taken in a convenient quantitie, according to the strength of the venome and the patient that shall take it, so as the quantitie for a time exceede not ten graines taken in broth or water, or other liquor, is a most certaine speedy remedy against the venome of the most virulent Serpents that are, even the Viper *Regulus* (that is a Serpent that hath like a cappe or crowne on the head) the *Aspis* or any other, and the pouther strewed on the bitten place: they use to file the wood small either with the Sea dogges skinne, or a fine Iron file: in the same manner likewise they give halfe a scruple of the pouther in warme water, or the broth of a Chicken or Hen to them that are wounded with poisoned arrowes, which they much use one against another and put on the pouther into the wound: being taken in the morning betimes fasting, having made a spare supper over night before: it helpeth to evacuate all tough thicke and melancholy humors, and herebe helpeth quartaine and quotidian Agues, prevalleth against the Iliacke and Chollick passions of winde or humors, the dropsie also, the gravell and stone in the backe or kidneyes, the difficultie of urine and the most cruell chollerick passion, and other old griefes likewise in the joynts and legges, as well schirrous as scrophulous, that is, have hard swellings or nodes and knots in them, the same also killeth the wormes in the body of all sorts: it regaineth a dejected or lost appetite, and if the purgation worke too fiercely upon any to the patient is given halfe a small cup full of *Canis* (that is the decoction of Rice) to stay the working suddenly, or else by eating a small Birde, so that it is in the Phisitions or the Patients power to be purged as much as they will: by the taking of this medecine there not hath bin found any trouble to the stomack, or other ill symptomes, although taken without observing any diet, or defraining their businesse abroad, yea in the working thereof living most loosely: it is observed likewise to be availeable in the old paines and griefes of the head, the Megrime, Falling sickenesse and Apoplexye, in the diseases of the belly and wombe, as also the shortnesse of breath, the noyse and singings in the eares, and the goute or joynt aches; it is given in all seasons to all ages to differing natures or dispositions, and that without eyther danger or trouble: but that onely in chollerick persons and that have hot stomackes and Livers, it breedeth some perturbations in them untill that they have taken some meate, and in some it hath procured a vomit; but to the hot and chollericke persons being given with the Syrupe of Vinegar or in the fruit of a Charambola being preserved, or in a Pill with Conserve of Roses, it taketh away all those troubles. In some also it causeth an itch in the fundament, and sometimes excoriation, and the Piles also in some, but very few, which are soone helped by other remedies. These cures have beene often performed, and yet the Indians performe many other no doubt, which they conceale from the Christians all that they can. This wood is called by them *Panava*, the seede hereof is much used through all the Provences of the Indies to catch birds, being carryed thither to bee sold, for some thereof mixed with boiled Rice and cast to the wild Birds causeth as many as take it to fall downe to the ground, as being stoned for a time, but if any take thereof too greedily, it will kill them if they bee not helped by cold water put on their heads, but Dawes above all other Birds are soonest kild hereby.

Chap.

CHAP. CXLII.

Lignum Colubrinum. Snake wood.

THere are divers sorts of Snake Woods, *Acosta* hath set forth two or three, that he knew used by the Indians against the bitings of Vipers, Water Snakes, or the like Serpents, and yet as *Clusius* saith none of those agreeth with these three that *Garcias* maketh mention of, *Bauhinus* calleth them all *Clematis Indica*. The first of *Garcias* is rather a roote then a wood, and groweth with foure or five slender branches, about two foote high, the leaves are like Peach leaves, but more shining, the flowers grow many together on a long stalke in clusters, of a brave red colour, the berries are like those of the Elder, clustering together, and red and hard. The roote, which is most in use, is full of knots or heads, growing above ground, with many small strings under them, being of a whitish ash-colour, and of a firme substance, with a little bitternesse in the taste: it is called by the Inhabitants *Lametal*, and by the *Portugals Páo da cobra*, that is Snakewood: This roote being beaten into pouther is given in wine or some cordiall water to those that are bitten by any Serpent, and likewise taketh away spots and pushes, or wheales, or other fretting sores in the skinne, and is held to be good against that cruell disease, which they call *Mordexi*, and some take to be Plague, or other dangerous infectious disease, and some call it the Chollericke passion, it is held also to be good against agues, an ounce thereof bruised and steeped in water, purging much choller by vomit. His second sort as he saith when it standeth alone, groweth to be a tree, and is like the Pomegarnet tree, set with thicke, short, and hard thornes, with a whitish thicke and firme barke, full of rifts, and a little bitter, but not so much as the former, the leaves are of a yellowish greene colour, very pleasant to behold: but if it grow by any other tree, it will clime thereon by the branches unto the toppe like a Gourd: they use to give both the wood and the barke hereof, but especially the roote in the same manner aforesaid, and for the said purposes: it groweth in the Isle of *Goa*. His third sort was brought to the Vice Roy, in certaine small bundles of wood with their rootes to them, being slender, hard, blacke and sweete smelling, which rootes they of *Iasanapatan*, being an Isle nigh unto *Zeilan*, did wonderfully commend against venome or poyson. It groweth up with a few slender branches, foure or five cubits long, which if they be not tyed or held up will lye on the ground, having a few thinne long leaves like unto those of the Masticke tree for the forme, yet not greene but spotted, with whitish blacke markes upon them. The first of these as *Garcias* saith, was found to be effectuall against the venome of those virulent Serpents, by this meanes. They have there breeding with them, a certaine small beast, as great as a Ferret, which they call *Quil*, or *Quirpole*, being a deadly enemy unto the Serpent *Regulus*, with whom when soever it fighteth, it eateth of the heads of one of those rootes, that is bare above ground, which having chewed, he casteth his spittle upon his head, and over the rest of his body, and his fore feet also, and then fighteth with that serpent, and will not leave it untill he have

Garcias primum.

Secundum.

Tertium.

Lignum Colubrinum primum Acosta.
Acosta his first Snake wood.

Lignum Colubrinum secundum Acosta.
Acosta his second Snake wood.

killed it. Many *Portugalls* at severall times have beene eye witnesses to these battels: for they not onely keepe this small creature in their houses, to sport themselves with these combates, but to kill their Mice, whom they most eagerly hunt and kill. There are also certaine wandring beggers called *Jogues* who doe often carry about with them these serpents *Regulus* tame, making men beleeve they have enchanted them, and some likewise that are fierce, whom for a reward they will suffer these Ferret-like beasts to fight with.

Lignum Colubrinum primum Acostæ. *Acosta* his first Snake wood.

The first sort of Snake wood that *Acosta* maketh mention of, groweth in *Malabar*, somewhat after the manner of Ivy, spotted like unto the stalke of Dragons, and so like unto a serpent, that he that should see it at the first, not having seene it before, would take it for a very serpent, especially beholding it in the Moone light. The first leaves it hath are broad, and whole without any cut or devision on the edge, but those that come after are like allmost unto Bryony leaves with a ribbe in the middle of them; and five or six others, running from thence to the edges, and lastly, some cut into divisions like a Vine leafe, all these sorts of leaves being to be seene at one time on the stemmes and branches, that they would seeme not to be the leaves of one and the same plant: This wood is held to be the most soveraigne remedy against the venome of all sorts of serpents wherewith they abound, that by the onely sent thereof, carrying it continually about them, the serpents will flye from them as they walke in the fields, and if they doe touch any of them therewith, it will make them to breake in peeces and dye.

Lignum Colubrinum secundum Acostæ. *Acosta* his second Snake wood.

Another sort groweth low and small, having onely three leaves set together, which are soft, long, and narrow, smooth, and of a darke greene colour, it hath not beene knowne to beare either flower or fruite; the roote is long and slender, smaller then ones little finger, running along under the surface of the ground, and knotted in divers places, the outer rinde being very thin and of an ash-colour, having at the first little or no taste therein at all, but after a while it yeeldeth a fine sent and taste like Muske, this barke chappeth in many places, shewing under it another thicker, and yellow, of the sent of *Trifolium odoratum*, Sweete Trefoile, and tasting sweete like Licoris, but not abiding long, the substance whereof is wooddy, and called in *Canarin*, *Duda Sals*: this roote being beaten into pouther and taken in Wine or Water, is said to be a certaine and present remedy against the bitings and venome of any serpent whatsoever: it is much used likewise in tertian and day agues, the weakenesse of the stomacke, the trembling and passions of the heart, or swounings, and against all sorts or poysons: many have affirmed that no serpent had power to doe him harme that but held it in his hand, and that the sight thereof would make the serpents flye from it to some other place: it is held also to be good for those that have stinking breathes, or have stincking foule hollow teeth that give an evill savour, to hold it in their mouthes, or to put it into the hollownesse of the tooth

A third sort is found in the same Provinces, and is a tree of a very large size and greatnesse, whereof peradventure that was a peece that *Clusius* saith he had of Doctor *Hector Nunes*, the *Portugall* Physition here at *London*, the wood being like a peece of Ash, firme or close, with certaine veines running therein, the rinde or outer barke being of a whitish ash-colour, and tasting somewhat bitter.

CHAP. CXLIII.

Cohyne. The Indian rattling God.

Cohyne. The Indian rattling God.

THe *Portugals* possesse a certain Country in *America*, called *Morpian*, which is ful of very good fruits, and among the rest the *Nana* or *Pinas*. There is also growing a tree whose fruite they call *Cohyne*, having leaves like to those of the Bay tree, and fruit as bigge as a Melon, formed like unto an Estridge egge, which although it is not eaten by any of them yet is very beautifull hanging on the tree. The Savages use to make drinking cuppes of them, but besides that they commit Idolatry there with, which is wonderfull, and to be lamented, for having emptyed and made hollow these fruites, they fill them with the seedes of *Milium* or some other thing, which being shaken with ones hand, or with the winde, will make a noyse: then doe they fasten a pole into the ground, and sticke this fruite full of those seede on the toppe thereof, and fasten about it the most beautifull feathers of birdes they can get: Every house hath two or three of these fruits decked up in this manner sticking on the poles, which they have in great reverence, thinking some god to be in them, because when they are shaken they make a noyse and their priests and prophets make them beleeve their God, whom they call *Toupan*, speaketh and telleth them what they should doe, and what shall come to passe, and it is not to be found that they worship any other thing. *Clusius* saith that this fruite is called *Maraka*, and *Tamaraka*; but I thinke these names smell somewhat of a

Greeke

Greeke Godfather, as the *Tamalabathra* from *Tamalapatra*: yet others say they are their hand-rattles wherewith they dance.

CHAP. CXLIV.

Palma Hairi. The thorny *American* Palme tree.

THis tree groweth in some parts of *America*, both in shape of body and leaves like unto the Date tree, but full of sharpe thornes, bearing fruite as bigge as an hand-ball, but pointed at one end, having within it a fine snow white kernell: the wood of this tree is as blacke as blacke marble, and sincketh in water because of the heavinesse, and therefore some have thought it to be Ebony, but *Thevet* contradicteth that opinion with these reasons: first that Ebony is a wood more blacke or shining, and then that Ebony beareth no thornes, and lastly, Ebony is not found in *America*, but in *Ethiopia*, and the East Indies, about *Calecut*, &c. The Indians of this wood make them swords, which for the massinesse give a mighty blow, and will breake both scull and bones, where it lighteth on any, although it doth not cut as our swords doe: they make also arrowes of them, which by reason of their hardnesse like iron, and the points of them burned, to make them so penitrable, that they will be able to pierce a good corselet.

Palma Hairi. The thorny American Palme tree.

CHAP. CXLV.

Palma scriptoria & aliæ arbores, cujus folia & cortices chartæ vicem præbent.
The writing Palme tree and sundry others, whose leaves and barkes have supplyed the office and want of Paper.

THere are sundry sorts of trees growing both in the East and West Indies (although none of the Nations of the West Indians, except the *Mexicanes* know any use of writing, or Letters, before the *Spaniards* first entrance among them, but the *Spaniards* there made use of divers in the want of paper) whose leaves and barkes have beene used to write on (besides the ancient paper Reed, which served the former Greekes and Latines to that purpose for many ages, whereof *Pliny* hath largely intreated, and *Guilandinus* as largely commented upon him, and whereof I have entreated also in another place of this Worke) as namely sundry dwarfe Date trees, whose leaves have so smooth a surface that they served them very finely to write on, that is, with a small pointed iron, to engrave their characters therein. There is also growing in the Country of *Mangi*, which is neere the *Tartars* and *Chineses*, a certaine tree called *Tal*, and *Yguetal*, whose leaves are very large, and through all those Countries are used to be written on: it beareth fruite like unto great Turneps, whose meate under the outer rinde or barke is tender, sweete and edible. *Oviedus* maketh mention of two certaine trees growing in *Hispaniola*, the lesser called *Guajabara* by the Indians, and by the *Spaniards Uuero*, because the fruite thereof are like Grapes: the wood whereof is reddish, sound, and thicke, and fit to make coales, it beareth the fruite more loosely separate in sunder then the Grape, and of the colour of the Mulberry or Rose, having little substance thereon to be eaten, for they be as great as an Hasell Nut, and a stone within it is almost as great: the leaves of this tree are broad

Palmeta humilis scriptoria.

Tal.

Guajabara.

broad and round, as bigge as the palme of ones hand, as thicke as two Ivy leaves, and greene, and sometimes reddish, whereon the *Spaniards* used to write with an iron pen or pointell on both sides of the leaves, but they must be fresh gathered and presently written upon, which Letters then will appeare white, in the greene or reddish leaves that they may be easily read, notwithstanding the middle ribbe, and the other veines therein, in that they will not hinder ones hand very much. The other tree they call *Copey*, growing greater and taller, whose leaves are round like unto the other, but twice as large and thicke as they, and therefore better to write on, the middle ribbe and veines being also smaller, and thereby hindering the pointell from the graving thereon so much the lesse: these leaves also the *Spaniards* made use of for playing cards, engraving the formes of Kings, Queenes, &c. thereon, and would not easily be broken. *Nicholaus Coſtintes* in his journall setteth downe that neere the City *Cael* where pearles are found, there groweth a tree, whose leaves are so large that two or three men may be kept dry in their journeyes, having one of them spread to cover them, for they are of sixe braces or fathomes in length, and as many in breadth, which leaves also serve them very fitly to write upon, each of them being so thinne and plyable withall, that being foulded up handsomely together, one may carry one of them in their hand. *Duret* also among his admirable plants remembreth the *Melt* or *Maguey* of the *Mexicanes*, or rather *Metl* and *Maguey*, which is the *Aloe Americana*, set forth in the second Classis of this Worke, of whose leaves they made use to write or engrave what Records they would keepe, or what else they thought good. *Cluſius* also maketh mention in his first Booke of Exotickes, and fourth Chapter, of two sorts of barkes of trees fit to write on: the one white and like unto the thinnest parchment which was gotten in *Iava*, by those that returned home with Sir *Francis Drake*, in his long voyage over the world, which by tryall was found fit to write on. And as he saith it might be was taken from that tree that *Antonius Pigafetta* maketh mention of in his journall, that in the Island *Tidore*, the women cover their privy parts, with a certaine cloath made of the barke of a tree in this manner: after it hath beene steeped so long in water that it is growne soft, they beate it with woodden mallers unto what length and breadth they please, making it so thinne as silke, having the crosse veines running through it: And it may as likely be such as the *Chineſes* make their paper, some Bookes of herbes being brought into the Low Countries as *Cluſius* saith, having both the figures of the herbes in them, and the descriptions, and vertues also peradventure, for they had *Chineſes* Characters on the sides of the figures. The other barke of the tree was not white, but somewhat reddish, but of so smooth and fine a polished surface, as no paper could be smoother and plainer, and was not thicke or grosse but without any difficulty might be parted into six leaves, each of them very well enduring to be written on with our ordinary incke, and yet not sinke any whit through it, which barke as he saith might have beene separated into more leaves if one would have been curious about them.

Copey. Thicke writing leaves or Printed Cards. *Guiabara.* New Spaines thin writing leaves.

Chap. CXLVI.

Palma pinus ſive Conifera. The Pine or Conebearing Palme tree.

THis strange kinde of tree being brought by certaine *English* Merchants, or Marriners, from the parts of *Guinea* where they traded, was of a wonderfull composure, for the toppe bough with the fruite thereon, was as it were mixed, of the nature of the Date, and Pine tree together, the wood being light and spongy, and wholly made of threds or haires, the outside or barke being like scales: it had about forty or fifty round yet somewhat flat branches, a foote long in the same manner scaly, or as it were set with hollow joynted cuppes or boxes, and from the joynts broke forth small cones like to those of the Cedar tree, set with thicke scales of a polished shining browniſh colour, the outer shell being of the thickenesse of the Indian Nut shell, containing within it a certaine kernell like unto a long Ackorne or Chesnut, of two inches long or lesse, very hard and not easie to be made into meale, yet serving the Natives instead of bread.

Fructus ſquamoſus Palmæ alterę ſimilis. Another kinde of scaly fruite like the other Palme.

Another scaly fruite like hereunto was sent unto *Cluſius*, but came a little after his death, which sheweth the stalke of the fruit divided into long fibers, the fruite also divided, whose inner substance betweene the outer shell and the inner kernell was blacke, the smaller end of which kernell lay next the bottome of the fruite, differing from those in the Cokar Nuts.

Chameriphes peregrina Cluſij. The strange dwarfe Palme of *Cluſius*.

This branch *Cluſius* referreth to the kindes of Palmetos as thinking it to partake with them: it rose up saith he

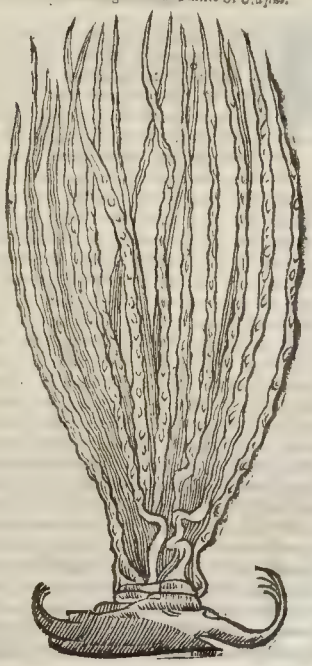
Chamæriphes peregrina Cl. fil.
A strange dwarfe Palme of *Clusius.*



he, with forty ſtalkes or more biggēr and leſſer, and longer or ſhorter then others, containing many appearances of flowers or fruites growing thereon, which were all rubbed off, onely the places where they ſtood, appearing and ſhewed as if they had beene all contained within a huske or covering, for the whole branch roſe from a certaine thicke barke, made as it were of ſhards like unto that of the outer ſhell of the Cokar Nut, or like unto that huske that covereth the *Palmeto* head, which barke was of a yellowiſh colour, ſmooth both above and below, but the ſtalkes were of a browniſh colour: this ſeemed to be plucked from ſome tree, but what or where is not expreſſed.

CHAP. CXLVII.

Gum Copal & Anime. Of Gum *Copal*, and Gum *Anime*.

THese two Gummes are gathered in the West Indies, as *Hispaniola*, &c. being very like one unto another: the *Copal* is of a fine cleare transluced pure white gum in somewhat great peeces, and pretty sweete, although not so much as the *Anime* is, with this Gum the Indians used to perfume their sacrifices instead of Incense in their temples, and when the *Spaniards* first came among them, they perfumed them therewith: it is hot in the second, and moist in the first degree, for it hath some watery parts therein, it resolveth swellings, and mollifieth hard tumours: *Gomara* maketh two sorts hereof, the one more rugged and soft then the other. But there hath been brought of late dayes, an oiely or liquid substance called *Oleum de copal Iva*, and is of two sorts, the one yellowish, and of a more thicke substance somewhat like unto that *Balsamum* that commeth from *Hispaniola*, the other whiter and more liquid, but of as sweete a sent as the former, both of them being excellent good for wounds &c. The *Anime* is also a whitish gumme, running out of great trees, and is not so cleare or pure white as the *Copal*, but more fatty like unto *Thus* or *Olibanum*, yet in greater peeces then *Olibanum* and being broken is somewhat yellowish, and of a most sweete and pleasant sent being set on burning or cast on quicke coales, and is soone consumed. There is another Gum *Anime* of *Ethiopia*, bordering on *Africa*, which is called *Orientale*, to distinguish it from this West Gum, and is both clearer, whiter, and in greater peeces then this, and is so like unto white Ambar, that divers have taken it to be melted Ambar, and thereof have made beads, and bracelets, &c. the tree from whence it commeth is great, having leaves like Mirtles: but I have here before shewed you the true originall of Ambar, even to be a *Bitumen*, which hath his fountaines in the *Germane* Sea, and becommeth hard, after it hath beene a while in the aire: Of this Orientall *Anime* also, I have shewed you the opinion of divers, both in the Chapter of *Lacca* and *Mirrha*, first that there is three sorts thereof, brought from *Guiney*, &c. by the *Portugals* and others, whereof that which is white is taken by *Garbias*, *Amatus Lusitanicus* and others, to be the true *Cancamum* of *Dioscorides*, and called *Anijmum* by the *Portugals*, serving for perfumes and censings: Another sort which is browne is taken by divers to be the *Myrrha Aminnea* of *Dioscorides*, as is before said: The third sort is dry, of a pale colour, and is easily broken like Rossin. The West Gum *Anime*, is of much use in the desluctions of rheume from the head, and other diseases of the head, rising from a cold cause, the head-ache also and megrime, and where there is want of sleepe to burne it, on a few quicke coales and aire ones head and their night cap with the smoke, which warmeth and comforteth the parts very much: and is herein very like unto *Thus*: it is used likewise in plasters to warme and strenghthen the cold and weake sinewes or any other part of the body afflicted with cold: it comforteth also a cold stomacke and helpeth to dissolve winde: it is also hot in the second and moist in the first degree.

CHAP. CXLIX.

Resina Americana quædam, Certaine West Indie Rossins.

THere are divers other sorts of gums Rossins; and liquours brought both from the East, but especially from the West parts, some whereof by good experience have given much helpe they to those that have used them: many other more then they have beene brought, whereof wee have knowne no use or name, nor have made any tryall what effect they carry, and therefore to avoyd tediousnesse, and that this Worke being growne great, should not be overcharged with needlesse and unprofitable matter. I will onely in this Chapter shew you some of the chiefest that have beene either mentioned by others, or not set forth before now. The first is the *Resina Carthaginensis* set forth by *Monardus*, that was gathered by *Carthago nova* in *America*, and is a most cleare and most sweet liquid Rossin excelling either the Venice or the true Turpentine in the effects. For it is by often experience found to be singular good for wounds in the nerves and sinewes, and the joynts or for old sores in the legges and feete: women by washing and preparing it in a convenient manner, doe use it on their faces to take away wrinckles, spots, &c. and to preserve their youth and beauty. Another sort is called also by *Monardus Resina Abiegna*, that is Firre tree liquid Rossin or Turpentine and is gathered from great wilde trees that can neither be said to be Firre or Cypresse, being taller then Pine trees, and straight, growing up like the Cypresse: towards the toppe of these trees grow certaine bladders or skinnes some greater and others smaller, which being broken this admirable liquour droppeth forth, which the Indians carefully doe gather into shells, but with a great deale of labour and trouble, and but a little in a great time. The use hereof is as effectuall as *Balsamum*, for all the causes for which *Balsamum* is used, for it excellently healeth all sorts of wounds, and easeth all paines and griefes rising from cold or flatulent matter: it is also singular good against the paines or winde in the stomacke and bowels, to take some in white wine. A third sort of liquid substance is called *Liquor Ambia* and came to him in the hollownesse of a cane or Reede, and was taken out of a spring or fountaine in the ground, farre from the sea, being thin and yellow like hony, and smelling like *Tacamahaca*, which was signified unto him to be of excellent vertues, especially in cold inveterate griefes, and aches in any part of the body, and taketh away the cold shivering fits of agues: it resolveth also all kindes of hard tumours, and performeth whatsoever either *Caranha* or *Tacamahacca* can doe: it is of so sticking and cleaving a substance, that it will not be pulled from the place whereon it is set, untill by time the vertue is spent and it growne dry. *Gum Colliman* or *Caramam*, is a kinde of blacke gum almost as blacke as pitch, that Sir *Walter Raleigh* first brought from *Guiana*, and those parts, and brought it also first into use for a cold moist and rheumaticke braine, and giddinesse thereof, and for defluxions of humours, as aches in the joynts or other parts, into the shoulders or other parts of the body, or for windinesse in them running from place to place, eyther by it selfe or sometimes mixed with *Caranba*: Of it selfe it is very hard, and smelleth sweete, but being distilled is much sweeter, especially the last part, that commeth forth after the two first stinking oyles, and is used by some perfumers as an excellent perfume,

Resina Carthaginensis.

Resina Abiegna Indica.

Liquor Ambia.

fume. It is good alſo for reſolutions, or as ſome call it the dead palſie, and for the paines of the mother, and the lower part of womens backes, which muſt be ſpread upon leather as a plaiſter and laid thereon, and not taken away till it fall of it ſelfe: it is alſo ſingular good to eaſe the paines of the gout, and of excellent vertue in the cure of wounds: all theſe properties have beene found certaine by good experience.

Barratta, is a moſt ſoveraigne *Balſamum* farre excelling all others yet knowne, which by true experience is found to be of eſpeciall operation in the cure of greene wounds, and being burned upon coales is a moſt ſweet perfume.

And thus to finiſh this whole Worke and bring it to a period, let me onely ſhew you ſome of thoſe things not ſpoken off before in this volume, which have beene made knowne to us to grow in our ſeverall plantations of *Virginia*, the *Barmudas*, *New England*, or elſewhere among our owne peoples habitations: and firſt,

The poyſoned weed is like our *Engliſh* Ivy.

The purging Beane is a kinde of Wood bind, running on trees neere the Sea ſide.

The Mancinell tree beareth a ſmall apple like fruite, ſweete in ſmell, but poyſon to eate.

The Guane tree beareth a fruite as bigge as a Peate, and good to eate.

They have alſo Apple trees differing from ours.

Cherryes likewiſe as bigge as Damſons, and yellow Plummes divers from ours.

There is a buſh like unto a Bramble that hath long yellow fruite within a hard ſhell.

Another tree they have that groweth great like a Pine tree that beareth fruite as great as a Muske Melon, is alwayes greene, and hath both bloſſomes, greene fruite, and ripe, all at a time.

Wilde Figge trees likewiſe they have, wherewith they feede their ſwine.

Then have they ſmall red berryes which they call red Pepper.

Goodly great trees which they call Cedar, becauſe the wood is red like Cedar, but the berryes are ſmall like unto Iuniper berryes.

Fuſticke trees, which give a yellow colour fit for Dyers.

A great tree with whoſe leaves they make Muſtard.

A kinde of roote which they tooke to be *Sarſa parilla*, but is not, although ſomewhat like it, being hard and wooddy, and hath no uſe that we know.

Mucca nuts grow cloſe to the ground like unto Hazell Nuts.

Penimaw is a kinde of ſilke graſſe.

Woghſacan, with the roote they cure their hurts and diſeaſes.

Meſſaminus are Grapes as great as Cherries, but with little juyce in them.

Rawcomens are like to our Gooſeberryes.

Ocoughtawmins, are berries like unto Capers.

Checinkamins like to Cheſnuts.

Tockahough is the Caſſada roote whereof they make bread.

Pappaw is a fruite as bigge as an Apple, of an Orenge colour, and good to eate.

And now unto God Almighty *Triuno*, and *Vno in Trinitate*, who I hope hath beene at the beginning of this Worke, and holpen me through all the paſſages thereof, notwithſtanding the *multa diſcrimina rerum mortalium*, whereof I have felt my part, to bring it to the end, for the benefit of others (who that they may make good uſe thereof, and not pervert it to any ſiniſter courſe, is my earneſt deſire) be given all the praiſe, honour, and glory, for I am but (like the Bee, that workes out waxe and hony for others, not his owne good:) his inſtrument to accompliſh it, receiving all from Him. *Amen.*

FINIS.

THEATRO BOTANICO APPENDIX.

An Appendix to the Theater of Plants,

or Addition of those things have beene over-slipt, mistaken, or to be amended in the Worke Precedent, to be referred as the number of *the Pages declare.*

Where observe that p. standeth for Page.

15. *Hyssopus Graecorum* so called by *Alpinus*, is that fifteenth sort in page the third, there called *Hissopus fol. ss Origani.* Round leated Hysope.

6. *Thymbra Legitima Alpino.* The true Savory by *Alpinus.* Page. 5.

6. *Thymbra Legitima Alpino.* The true Savory by *Alpinus.*

The differing forme and face that *Alpinus* giveth this small herbe from the former, hath made me insert it here to be referred to the other sorts, if so be it be another. It is very like unto the true Tyme as he saith, but hath smaller and slenderer branches, and Tyme like leaves, many being set on them by couples, but thinner and softer, and of an herby greene colour: the flowers are purple like Tyme and grow in spikes: it groweth lower then Tyme, smelleth very like it, and tasteth as sharpe as Tyme, when it is dryed.

18. *Marum*

10. *Marum Ægyptiorum Alpino.* The Egiptians *Marum* by *Alpinus* to be referred to p 13.

10. *Marum Ægyptiorum Alpino.*

The *Egyptians Marum* by *Alpinus* without sent.

This plant saith *Alpinus* accounted a *Marum* with the *Egiptians* and growing among rubbish and in dry places doth somewhat resemble a wild Clary in the leaves and growing, being voyd of taste or savour, especially the lowest, yet those that rise up with the stalke and flowers, are strong and not unpleasant, the leaves thereon being of a cubits height are white and hoary, and the flowers like those of Clary, the seedis small and round like Cabbage seed. They use to lay it among their garments, and Physically to expell winde powerfully, and to abate swellings.

5. *Origanum Indicum.* Indian Organy, or bastard Marjerome.

Prosper Alpinus in his Booke of *Egiptian* plants setteth forth one, he saith is there called *Zatarendi*, and describeth it to grow slowly with sundry branched stalkes and almost round thicke whitish leaves on them, full of sap or juyce, and very sweet, bearing neither flower nor fruite: they use it in their meates as others doe *Origanum*: thus much *Alpinus*. But *Veslingius* taking upon him to correct and amend him saith, that the plant called *Satarhendi* by them is this plant (whose figure I here give you from him, and as he saith did spring with *Signior Coutarini* of *Venice*, if there be not some fallacy or mistake in the matter, for besides that *Alpinus* figure hath little similitude unto this, he saith, who it is likely observed it long by saying it grew slowly, he observed in all the time of his abode in *Egypt* that it bore nothing: but as soone as it came into *Contarinis* hands, it bore according as other sorts of *Origanum* both flowers and fruite yet larger. I put this but as a doubt in the matter) and describeth it in this manner. This dainty plant riseth up to a footes height, with straight stalkes and soft tender Marjerome like leaves, upon them, covered with a whitish downe, or wooll, being almost round but pointed at the ends, with sundry pale coloured veines in them: It beareth many white flowers at the tops of the stalkes, bowing their round heads a little, which are made of many small leaves set together. It is somewhat aromaticall in taste with some pleasing acrymony, and a little astringent withall, but exceedeth in sweetnes that of *Candy*.

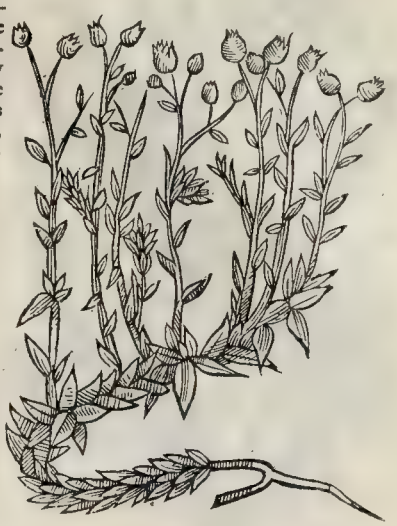
2. *Origanum Onitis Matthioli.* White Organy of Greece. p. 15.

5. *Origanum Indicum.* Another Indian Organy, or bastard Marjerome. p. 15.

10. *Polium Gnaphaloides.*
The hoary *Poley* mountaine.

This kind of *Poley* mountaine is wholly very hoary white all over, and having ſmall leaues like ſmall Myrtle leaues, a little dented about the edges, ſo thicke ſet on the lower crooked ſtemme, that they cover it, from whence ariſe divers other ſtalkes or branches, thinly ſet with the like leaues, and at the toppe of each of them a round head or umbell, upon a long bare ſtalke, conſiſting of divers yellow flowers, ſtanding in their ſmall cups, which growing ripe are turned into downe, and with the yellowiſh ſmall ſeed is carryed away with the winde: the roote is ſmall, ſlender, and long. *Alpinus* only maketh mention hereof *lib. de plantis exoticis.*

10. *Polium Gnaphaloides.*
Hoary Pole-mountaine. p. 25.



13. *Origanum fiſtuloſum Cornuto ſed potius Mentaſtrum fiſtuloſum Americanum.* A wild Mint of *America.*

The roote of this plant is wholly compoſed of long and ſmall fibres, which ſhooteth forth ſundry ſquare hairy ſtalkes halfe a yard high, ſet with two long and ſomewhat broad leaues at the joynts, ſomewhat reſembling thoſe of the Willow herbe: at the joynts come forth alſo divers branches with ſuch like leaues thereon, but leſſer up to the tops, where ſtand ten or twelve ſmal leaues in compaſſe, under the round head, compoſed of a number of pale reddiſh purple flowers, reſembling the head of a Scalion, each flower being long and hollow, biforked at the end, with two or three threds tipt with purple: in the middle of this round head ſhooteth forth ſometimes ſuch another round head of flowers, with leaues under them: the whole plant both ſtalke and leaues are covered with an hoary downe, and ſmelleth like Savory but taſteth ſharpe and fiery like Arſmart, yet the roote hath no taſte at all.

13. *Origanum fiſtuloſum Cornuto, ſed potius Mentaſtrum fiſtuloſum Americanum.* A wild Mint of *America.* p. 34.

2. *Stœchas flore albo.*
White flowred Caſſidony. p. 67.

Scordium spinosum odoratum. Thorny Sweete Scordium, or Water Germander. p. 110.

Scordium spinosum odoratum.

Thorny sweet *Scordium*, or Water Germander.

This annuall *Scordium* riseth up with square soft and hairy stalkes full of joynts or branches, which are fatty or clammy, whereat grow sometimes two, but at the greater joynts three leaves, which are variously formed, the lowest being largest, are dented or cut on the edges, like unto the ordinary or Water Germander, but still up higher the smaller and lesse dented, at the joynts of the branches grow many times long thornes, but alwayes end in a small long soft pricke or thorne, and at the leaves also come forth small Germanderlike flowers, but whitish, with three small threds within them: in the huskes that contained the flowers, being falne rise fowre small seeds which must be sowne every yeare: the roote is very long and fibrous, and perishing after seed time: the whole plant smelleth almost as sweet as *Bassil*, and was gathered upon some of the dry, barren and sandy mountaines in *Spaine*, and mentioned onely by *Cornutus* in his *Canada* relations.

Having another figure of this *Valerian* by me, differing in some things from the former, I thought good to exhibit it likewise unto you, that you may see how the alteration of climates causeth such formall diversities as are here perceived in rootes, leaves, and flowers.

18, 19. *After Americanus praecocior & serotinus latifolius & angustifolius.* Two sorts of Virginia Starrewoorts. p. 132.

2. *Nardus montana veterum.* Mountaine Nardus of *Candy*. p. 120.

2. *Scammo-*

2. *Scammonea macrorhyzos Cretica.*
Long rooted Scammony of *Candy.* p.164.

4. *Laurus sylvestris Cretica Alp.ni.*
The shrubby wild Bay of *Candy.* p.267.

To the end of the 25 Chapter of the second Classis, page 216. adde these words. But *Petrus Castellus* hath published a Tractate Printed at *Rome* 1612. in quarto, or as he calleth it an Epistle to *Iohanes Menelphius*, and *Aetius Cletus*, wherein he contesteth, that the *Helleborus* simply so called, as well in the Workes of *Hippocrates*, as other Authours entreating thereof, is to be understood of the white kinde, wherewith both the mad daughters of *Prætus* King of the *Argives* were cured, as also *Hercules* madnesse by the *Anticyrean* medicines (whose seed being like unto *Cnicus* was called *Sesamoides*) whose assertions I am sure are quite contrary to *Dioscorides*, that directly appropriateth the cure of *Petrus* daughters unto the blacke Ellebore, and therefore called also *Melampodium*, because *Melampus* the Goat-heard plaid the Physition therein.

3. *Acacalis Camerario Bollonio & aliis.* A *Syrian* plant like unto the Carob tree.

Being omitted in page 236. where it was entended to be set forth, that it be not utterly left out, accept it in this place. *Paludanus* saith *Bauhinus*, in his returne from his *Egiptian, Syrian, &c.* peregrination *Anno* 1579. brought some seedes of a *Syrian* plant, called there *Kismisen*, which being sowne brought forth round leaves, which he doubted was the *Acacalis* of *Dioscorides Camerarius* also saith that he (as it is likely having received of the same seeds from *Paludanus*,) sowed some seed that was eight yeares old, sent him by the name of *Acacalis*, and called in the *Syriack* tongue *Kismisen*, and *Sisime*, from whence rose a tender plant, somewhat like unto the Carob tree, upon the first springing of it, having gained that yeare onely foure round leaves, set by couples, each opposite to other on the middle rib, whose stalke was somewhat hairy: This perished also at the beginning of Autumne, so that no more can be said thereof, but that the seed was somewhat broad and round at the one end, and pointed at the other. But although this bore the name of *Acacalis*, yet did it not answer to *Dioscorides* Text, (or *Ægineta* that transcribed it from him) that saith it is the fruite of an *Egiptian* plant, that is somewhat like unto Tamariske. *Cordus* commenting on *Dioscorides*, saith it was not knowne in his time, unlesse some would referre it to the *Elmblick* or *Bellirick Myrobalanes*, which is as farre from truth, as an Oake from an Apple. *Belonius* also remembreth it, but giveth no description of it: So that neither being perfectly described by *Dioscori-des*, nor certainely knowne of our Modernes, I can say no more thereof.

2. *Myrobolani Chebuli ut fertur Icon vera.*
A true figure of the purple Myrobalane or purging Indian Plumme.

Veslingius in his furvay of *Alpinus* his *Egiptian* plants faith, that he often faw in the Orchard of a certaine chiefe Turke, a tree growing, which the keeper therof called *Dileg el chabul*, growing to be as bigge as a Plume tree, with a fmooth pale coloured barke, the wood being whitifh and fomewhat fweet, the branches fpread fairely and thicke, bending eafily and hardly breaking, armed with fharpe long thornes: the leaves are fet by couples together on a fhort footeftalke, being fomewhat long with the roundneffe, and a little round pointed (nothing like unto Peach leaves, as is formerly fet downe) the lower ones being larger then thofe upward on the fame branch: and without any dent on the edge. The fruite is of a reafonable greatneffe, bigge in the middle, and fmall at both ends, and of a darke or blackifh red colour, and fomewhat fapide. They ufe to preferve them, and fo impart them to thofe of the greateft ranke, and have a purging quality in them.

8 *Rubia fylveftris argentea Cretica.*
Silver-like wilde Madder of *Candy*.

This fmall *Candy* white Madder, from a fmall long flender roote fhooteth forth divers ftalkes, not halfe a foote long, with fundry fmall, long, foft and filver coloured leaves fet by fpaces, fome times but two, other whiles foure at a fpace, and with them upwards to the toppe, fmall yellowifh flowers, it is without any other tafte then a little aftringent, and is faid to be profitable for fluxes in man or woman.

2. *Myrobolani Chebuli ut fertur Icon vera.*
A branch of the true Chebull Myrobolane, or purple purging Indian Plume as it is thought, to be referred to p. 246.

Capnos fabacea radice.
Bconkens Holwortel, or fmall round roored Fumiterry. p. 288.

8. *Rubia fylveftris argentea Cretica.*
Silver like wild Madder of *Candy*. p. 277.

Page 380, Line the ſixteenth, put out *Panaces Carpimon ſive racemoſum Canadenſe*, but why *Panax* being no wound herbe, I ſee no cauſe unleſſe it be for want of a better name, put out as I ſaid all this, becauſe it pertaineth to another place.

Page 380, Line the ſixteenth, put out thoſe three laſt lines in the *Names*, and inſtead of them put *Aconitum bacciuibeis & rubris*: but I thinke I have more truely referred it to the *Chriſtophoriana*. In the *Vertues* likewiſe put out the *Panaces Carpinon*, and all that followeth, and in the place thereof ſet theſe lines. *Cornutus* ſaith, they gave it the name of *Aconitum*, rather from the likeneſſe unto an Aconite then from any deliteriall quality they knew to be in it, and ſuppoſeth that the white berries ſhould rather portend good then harme.

Page 387. Lines part of the 18 19 and part of the 20. are to be ſtrucke out, not being intended for that place, as may plainely be diſcerned by the relation. And in the ſtead thereof read theſe lines: The fourth is called by *Cluſius Apocynum Syriacum Paleſtinum, & forte Ægyptium*, becauſe he referreth it to the *Beidelſar* of *Alpinus* in his Booke of *Egiptian* plants, and to the *Oſſar frutex* of *Honorius Bellus* in his third Epiſtle to him, ſaying withall, that Doctor *Chriſtopher Weixius*, gave him the dryed branch, which he ſet forth, and that as he told him he gathered it neere the River *Iordan*, in *Paleſtina* where it grew, and the people there called it *Beidſar*: this is *Cluſius* his relation and judgement thereof: I have ſaid ſomewhat hereof in my former Booke, page 444. But I would to explaine it the better, adde ſomewhat more thereunto. Firſt that it is not probable to me that this plant which *Cluſius* ſetteth forth (and is without all queſtion the very ſame that roſe with me from the ſeed was brought out of *New England* upon the firſt diſcovery thereof, both ſtalkes, leaves, and flowers, agreeing ſo exactly thereunto, and both forme and colour of the flowers anſwering it in every point, onely the pods white ſeed anſwereth not unto this, which I doubt therefore is but miſtaken) ſhould be found naturall to thoſe parts, ſeeing as I ſaid it is naturall to *Virginia*, or *New England*, and eſpecially that the name *Beidſar* ſhould be given to it, which is moſt probable belongeth to that of *Alpinus*, and *Bellus*, which is quite a differing plant from this as I ſhewed in my former Booke, both from the growing hereof, which dyeth downe every yeare, and from the milke it giveth, which is not cauſticke like the Oſſar, and in the rootes which are running under ground, which the other doth not. And thirdly, they ſay that the *Oſſar* or *Beidelſar* beareth yellow flowers, and not expreſſed to grow in cluſters as this doth; and Laſtly, that the pods of this *Apocynum* are crooked, according to the forme expreſſed in the figure, when as thoſe of *Oſſar* are round like Teſticles, and thoſe that *Cluſius* ſetteth forth are not crooked like unto theſe. *Bauhinus* in following *Cluſius*, ſheweth that he never ſaw the plant, and therefore taketh it for graunted whatſoever he ſaid, or *Weixius* informed him, when as by this that I have here delivered it is probable *Weixius* was miſtaken, and that hath cauſed all theſe errours: as alſo that of *Bauhinus*, that would make it a kinde of Docke, calling it *Lapathum Ægyptiacum lacteſcens ſiliqua Aſclepiadis*, which hath ſo little correſpondence with reaſon and judgement, that I wonder that ſo famous an Herbariſt as *Bauhinus* was, ſhould relye upon anothers fooliſh opinion in the denomination thereof, and ſo divulge it to the world, whereof I have formerly ſaid ſomething: The fifth is remembred by *Cornutus*, among his *Canada* plants.

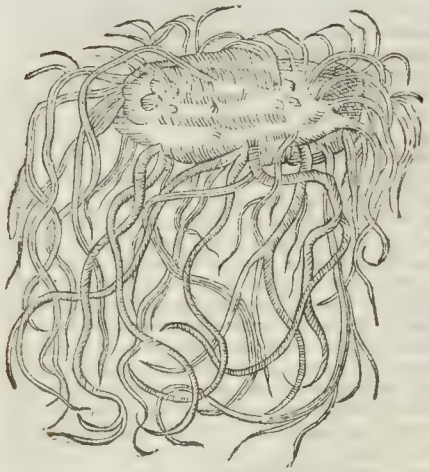
Ranunculus ſylvarum ſive Anemone ſylveſtris flore pleno albo. The double white wilde Anemone to be inſerted in p. 325.

6. Pſeudopacynum Virginianum, alijs Gelſeminum Americanum maximum flore phœniceo. The great Orrenge coloured *Virginia* Ialmine. to be inſerted p. 385.

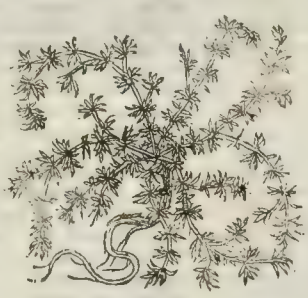
Of *Phalangium* in p. 418. *The Vertues.*

Spiderwort is of especiall property against all venome and poysons, as well of animalls, the Scorpion Spider *Phalangium*, and other Serpents, as of herbes and evill ayres or other quality whatsoever: it is held also to be preservative against infection, to continue the taking of the whole herbe, with the rootes either the pouther in wine or the decoction for a time, or to be tunned up with some *Angelica*, Goates Rue, and *Zedoaria*; it is singular good also against the winde and chollicke, to ease the tormenting paines thereof, and to avoid urine being stopped, or the paines of the stone.

R. de Contrayerva Hispanorum ut a Baptista Cortesio exhibitur.
The roote of the Spanish *Contrayerva*, as *Cortesius* setteth it forth. to be referred to p. 421.



6 *Polygonum Serpillifolio Lobelij.*
Lobels Knotgrasse with Mother of Time leaves. p. 446.



1. *Prunella vulgaris.*
Common Selfeheale. p. 526.

5. *Herminum sylvestre vulgare.*
Our ordinary wilde Clary, or *Oculus Christi*. p. 551.

5. *Gallium*

5. *Gallum montanum Creticum.* Mountaine Candy Gilflum. p.565.

16. *Sideritis Heraclea Dioscoridis, sive Sideritis marina Salvifolia nostra Donato.*
Another Sage leafed sea Iron wort.

The roote is of the bigneſſe of ones little finger, wrinckled and of a yellowiſh colour: the ſtalke is wooddy and ſquare, at the bottome whereof come forth leaves like unto Sage, but ſomewhat greener, the leaves that grow upwards upon the ſtalke, are like unto the *Candy* Horehound, round about the tops of the branches doe the flowers ſtand ſomewhat like unto Sage, ſet in certaine cups being of a whitiſh or yellowiſh aſh-colour. It healeth any wound or ſore, not ſuffering humours to flow thereto, and ſome *Arabians* ſay it ſtayeth womens courſes: the leaves chawed doe taſte like Maſtick. There is another hebe growing in the ſame Iſle of *Lio* of the *Venetians*, very like to this, but that the leaves are ſmaller, the ſtalke is ſlenderer, and the flowers that grow at the tops, are more like unto thoſe of the Common *Calamint*. *Altera.*

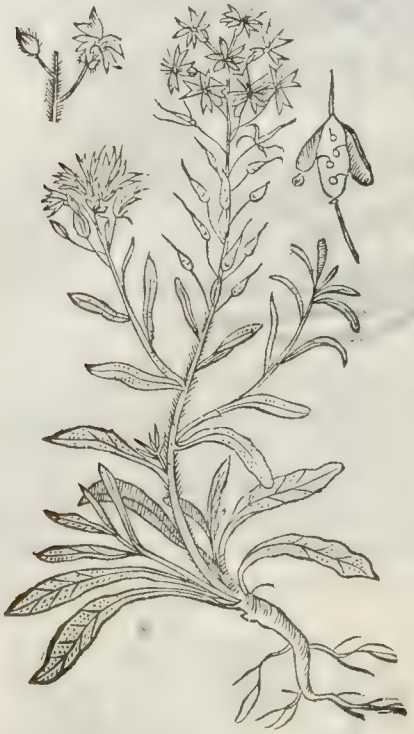
Aſyroides Cretica major.
Great Saint *Peters* wort of Candy. p.574.

16. *Sideritis Heraclea Dioscoridis, sive marina Sideritis Salvifolia:*
Sage leafed Sea Ironwort. p.588.

2. *Alyſſum.*

3. *Asyssum montanum Columnæ*
Madwort of *Columna*. p.590.

3. *Hesperis Pannonica latifolia*
Very many Dam's Violet of Hungary. p.628.



2. *Alsine major & media quibusdam.*
Great Chickweed, which with some is called a middle sort. p.760.

Viola tricolor flore duplici Hearts ease with a double [illegible] to be found in the [illegible]

Page.733. Line the fixt, before the laſt, inſert theſe references left out by overſight: The fourth with both the ſorts thereof are mentioned by *Cluſius*, under his ſecond *Cotyledon* and the ſpecies thereof; The fifth is onely remembred by *Columna*, who calleth it *Semper vivum rubrum montanum gnaphaloides*, *Bauhinus* not making any mention thereof that I can find: The fixt is the third *Cotyledon* of *Cluſius*.

The figure of *Alſine minor* is to be taken away, being the *Anagallis fœmina flore cæruleo*, unto whoſe family it ſhould have beene referred but was negligently thruſt in here inſtead of the *Alſine major & minor*.

Hieracium montanum tomentoſum ſive lanoſum.

A mountaine hoary and woolly Hawkeweed, to be inſerted in p. 779.

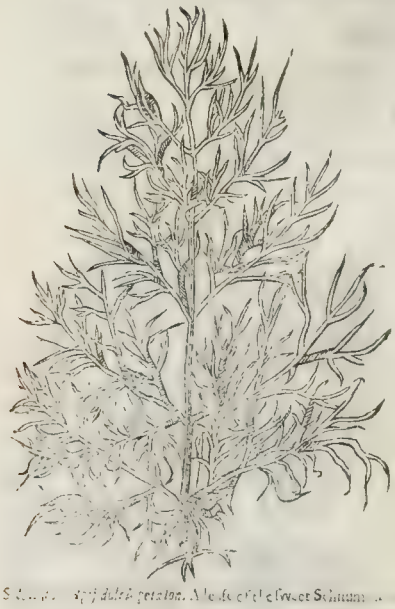
This woolly Hawkeweed (which I know not by what chance it was left out of its due place, and therefore here to be inſerted and not to be utterly neglected) riſeth up with ſundry ſoft hoary round ſtalkes about halfe a yard high, ſet at each joynt with one long, ſomewhat narrow and waved leafe, whitiſh alſo, ſoft and woolly, and pointed at the ends: the flowers are ſmall of a pale yellow colour, conſiſting of threds rather then leaves, ſundry of them ſet together at the tops of the branched ſtalkes, which in time turne into downe, which with the ſeed is carryed away with the winde: the roote is whitiſh and ſtringy, periſhing every yeare, and muſt be yearely ſowne, and if the yeare prove not kindly, that the ſeed may be gathered thereof (as oftentimes it ſo happeneth) you are to ſeeke new ſeed, or ſow the old if you have any. This came among *Boels* ſeed from *Spaine*, where it is likely he gathered it, and ſent both to Maſter *Coys* and my ſelfe onely, howſoever another prevents me in the declaration.

Melo vulgaris. The ordinary Melon. p. 772.

3 *Thlaſpi biſbutaeum villoſum flore cæruleo dorato.*
Spurre flowred Buckler Thlaſpi. p. 845.

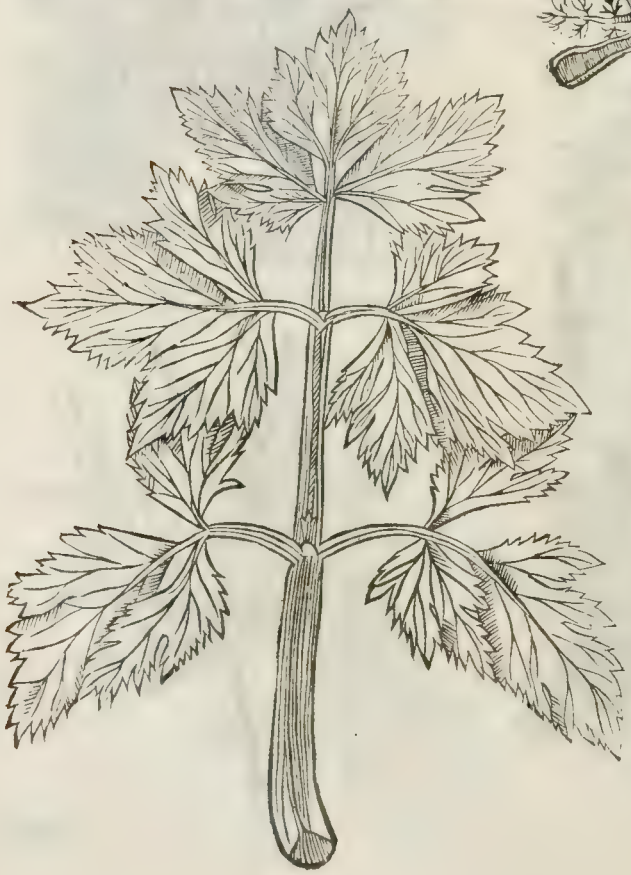
1. *Thapſia quædam latiore folio.*
Another broader leafed Fennel Thapſia. p. 877.

Libanotidis Galeni petalon genuinum
A true figure of the branchlesse Fennell leafed Frankincense, p. 881.



4. Pastinaca Echinophora Apula.
Prickly wild Carrots of Naples. p 901.

Selinum. Apij dulcis petalon. A leafe of the sweet Selinum [illegible] p. 926.



It may be a queſtion whether this *Selinum* be not of the ſame quality with the ſweete Fennell, and ſweete Cumin, &c. The ſweetneſſe onely cauſed by the heate of the climates which altereth in the colder.

Page 964. Line 15. All that firſt relation of *Cnicus alter* is to be blotted out, and the ſecond and third, is to be made the firſt and ſecond.

Having

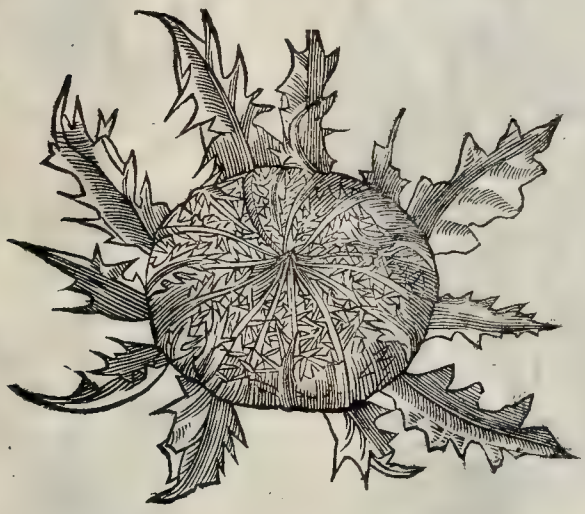
Having the ſame figure of *Laſerpitium* by me, that *Alpinus* ſet forth, I could doe no leſſe then ſhew it you, that you may ſee the difference of that ſtalke of leaves formerly exhibited, taken lineally from the vive Plant, and that of Lite from this of *Alpinus*, whoſe flowers and ſeed, is yet hid in the Embryon.

2. *L ſerpitium Alpino.*
Alpinus his Laſer wort. °p.937.

Page 1086. Inſert this. 10. *Aſtragollo ſim.lis palmata puſilla planta Lobelij.*
Lobels French ſmall Milke Vetch like plant.

This ſmall plant ſaith *Lobel*, he gathered on ſome of the hils of *Province* in *France*, having long wooddy rootes, covered with a thicke barke thereon, foulding one within another, and thickeſt at the head, from whence ſprung many ſtalkes that are hard, and but two or three inches long, whereon are ſet ſundry winged hoary ſmall hard leaves, like unto thoſe of Lentils, the milke Vetch or the Goates Thorne: at whoſe tops ſtand tufts of yellowiſh or whitiſh flowers, like unto thoſe of Birds foote, the plant is of a drying harſh taſte.

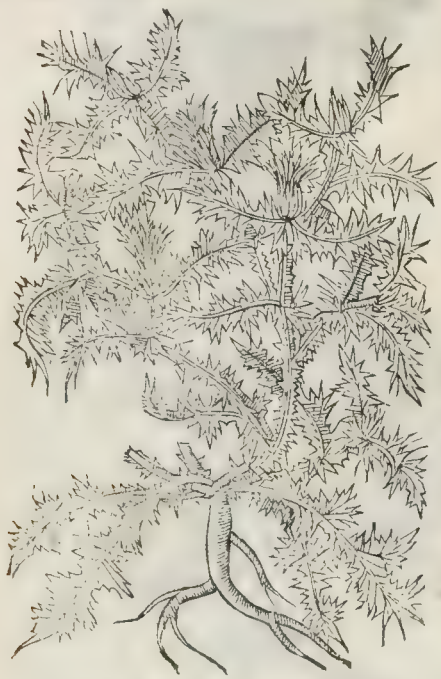
Carlina capitulum c'auſum. The cloſed head of the Carline Thiſtle; p.968.



This

3. *Scolymus Theophrasti sive Eryngium luteum Monspelliensium.*
The Golden Thistle. p.572.

This true figure of the golden Thistle was I know not by what chance left out, and a falſe one put in the place, let this therefore ſupply the others defect.



4. *Titimalus arenarius.* Small creeping Flaxe. p.1044.

7. *Rubus montanus odoratus.*
Sweete mountaine Bramble or Raſpis. p.1013.

5. *Lathyrus arvensis radicibus tuberosis.* A differing ſort of Earth nuts.

This ſort differeth chiefly from this former fifth in having all the leaves oned ſet by couples, whereas the former hath more, and the cods of the pods are more twined. This is *Thalius* his *Astragalus arvensis* p.1062.

14. *Trifolium corniculatum Creticum flore luteo.*
Horned Trefoile of *Candy* with yellow flowers.

This other horned Trefoile that came from *Candy*, where it is naturall, came to *Alpinus* as he saith, among other of their seeds, rising up with long and slender stalkes lying for the most part on the ground, having sundry small Trefoile leaves like a *Cytisus*, and somewhat broad forwards: The flowers grow at the ends of small stalkes, pease fashion, but small and yellow, with small round slender crooked pods succeeding, containing foure or five small yellow pease, which are eaten by the Natives even as the first sorts, yet is it not the same, for the pods hereof are slender and round although crooked, when as the other are flat and bigger. *Alpinus* onely hath made mention hereof, and differeth also as he saith from the *Trifolium Italicum corniculatum*, which is our *Lotus corniculatus incanus*, and the twelfth sort here.

Because I gave you not the figure of this Asphodill in my former Booke, although I gave you there the description, I thought good to shew it you now and referre you for the description to my former Booke. Yet this may take place for the present here, and accompany the greater Bastard kindes in page 1218.

12. *Linum umbilicatum*, Strange wild white flowred Flaxe.

This strange kind of Flaxe but annuall, rising up with slender hoary greene stalkes, branched towards the tops, having sundry whitish or hoary greene soft long leaves, set singly on them, somewhat broader and thicker then the ordinary wilde sorts, and with every leafe usually a small white flower, made of fine round pointed leaves, with a few threds in the middle, after which commeth the seede, set in the same huske that bore the flower, being somewhat like in forme and posture unto those of Hounds tongue, but not rough.

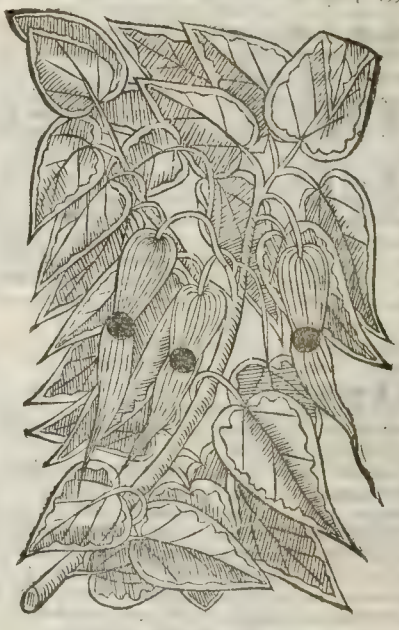
Page 1369. Line the fifteenth, reade it, We have another whose chiefest difference, &c.

14. *Trifolium corniculatum Lusitanum flore rubro. & Creticum flore luteo.* Horned Trefoile of *Portugall* with red flowers, and one of *Candy* with yellow flowers. p. 1103.

Asphodelus minor albus. The small white Asphodill. p. 1218.

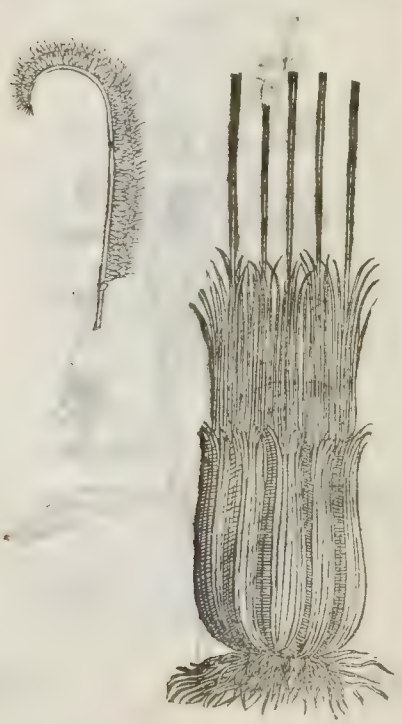
12. *Linum umbilicatum.* Strange wild white flowred Flaxe. p. 1336

Matth. Lobel. stirpium observationes & historia. The history of Plants p. 1200. *Macer Græcorum.* The Grecians Macer. p. 1599.



Tabernæmontani Nasturtium aquaticum sylvestre. Wild water Nasturtium or Creslyes, of the flowers, colour and smell whereof, see before p. 115 or to p. 1596. where it is mentioned and described.

Fructum Mimey. A leafe of the West Indian Peach Plum. p. 1633.



Vnto the eleventh number in p. [illegible] adde this. We have lately attained another sort [illegible] agreeing in most things therewith, but that the l[illegible] a tanner or fresher greene colour, the flowers [illegible] and called usually *Ocimastrum Valerianthos album.*

Canterberry Belflowers. 646. Coventry bellflowers. ibid.
Sea Bellflowers. 168. Steeple Bellflowers. 649
Blew Bellflowers of Virginia. 169
Indian Bellflower is the red Belflower of America. 170
Peachleafed Bellflowers, Indian Morrice like bells. 1633
Wild Bellflower. 650
Beetes garden, wilde and of the Sea. 750 Beech tree. 1402
Besome weede, is Thlaspie. 263. 1572
White and red Ben. 1571. Red Ben. 124. 263
The oyly nut Ben. 238. Bent grasse. 1159
Benzuin or Benjamin. 1572
The Turkes berry drinke. 1622
Bertram is Pellitary of Spaine. 858. Pauls Betony. 552
Water Betony. 613. Wood Betony 614
The Indian Betree. 1615
The East and West Indian Bezorstone. 1589
The Bezor tree. 1650
Billberries or Whrots, or Whortle berries of divers sorts. 1355. &c. Bisoleor Twayblade. 504. Marsh Bisvile. 505
The great white Bindweede, or Bellflower. 169
The lesser Bindeweeder. 170
The Indian Bindeweede called Betre. 1615
Prickly Bindeweedes. 173
Sea Bindeweede or Soldanella. 168
The Binding tree. 1366
Birch tree. 1408. Birds eye. 536
Birds foote. 1092
Starre codded Birds foote. 1095
Birds nest. 1361. Birds tongue is Knotgrasse. 444
Bishops leaves is Water Bettony. 613
Birthwort and the sorts. 292
Bishops weede. 912
Bistort or Snakeweede. 391
Bitter sweete. 350. Bitterwort or Gentian. 403
Blacke berry bush or Bramble. 1013
One Blade. 505. Bladder nut. 1417
Blites and the sorts. 752
Bloodwort. 1227. Bloodstrange is Mousetaile. 501.
Bolearmonicke. 1574. Bolbonach or white Satten. 1366
Bombast or the Cotten tree. 1552. Borrage. 1575
Borrage. 765. Euerliving Borrage in my former booke.
Booters is Marsh Marigolds. 1214
Bolts is Crowfoote. 333
Blew Bottles and the sorts greater and lesser. 481
Boxe Thorne. 1008. The Boxe tree. 1428
Dwarfe Boxe, and guilded Boxe. ibid.
Bramble bush and the sorts. 1013. 1686
The Bramble bush like stalke of America. 1629
Brake is Ferne 1038. Brunke Vrsine is Beares Breech. 992
The Brasill tree. 1644
The Indian Bread called Casavi. 1624
The Indian Bread tree. 1646
St. Iohns Bread or the Locust tree. 237
The wilde Bryer bush. 1017. The sweete Bryer or Eglantine. 1016
Brimstone wort, that is Sow Fennell, or Hogges Fennell. 886
White Briony and the sorts. 178
Blacke Brionie. 179
Indian Briony or Mechoacan. ibid.
Brookelime. 1236. Butchers Broome. 253
Broome and the sorts. 228
The Pliant Thorny Broome or Spalatos Thorny Broome. 996
Prickly or Thorny Broome. 1003. Broome Rape. 228
Base Broome. 231. Spanish Broome. ibid.
Brownewort is Water Betony. 613
Bruisewort or Soperwort. 641
Buckes horne, and Buckes horne Plantaine. 501
Buckes horne Cresses. 603. Sea Bucks horne. 1284
Bucks mast or Beechmast is the fruit of the Beech tree. 1402
Buckrams with Iomets Ramsons. 871. withothers is Wake Robin. 377
Buckes Thorne, or Rhamnus and the sorts. 1005
Bucks wheate. 1141. Bugle or browne Bugle. 524
Buglosse and the sorts. 765. Wall Buglosse. 518
Stone Buglosse. 519. Wilde or Vipers Buglosse. 413
Sea Marsh Buglosse of sundry sorts. 1234
The Sea Bulbe. 1288. Bulls foote is Colts foote. 1220
Bullockes Lungwort. 1633. Bullweede. 469
Bullocks eye, is great Houseleeke. 730
Bulleis tree in my former booke. Bullwort is Bishops weede. 912
Garden Burnet and Wilde. 582. Great Burnet of Canada. ibid.
Thorny Burnet. 997. Burre and the sorts. 1222
Butter Burre. 419. Burre Docke. 1222
Clote Burre, Ditch Burre, Louse Burre. 1223
Burre Reede, 1205. Water Burre is Burre Reede.
Water Burre Docke. The silver Bush. 1459
Butterflie Orchis. 1350. Butterwort or Butter roote. 534
Butchers Broome. 253

C.

CAbbages of divers sorts. 268. Cadlocke or Charlocke. 862
Cajous or apple beanes. 1568. Calamus Aromaticus. 138
Calamint and the sorts. 36. Land Caltrops. 1097
Water Caltrops great and small. 1247
Calves foote is Wake Robine. 377. Calues snout, is Snapdragon. 1334
Camfire. 1575. Camells hay or Squinant. 244
Camocke or Rest Harrow. 993
Camomill and the sorts. 85. 86. Sea Camomill. 1282
